

dependencies

Dependencies

External dependencies, API contracts, and gotchas.

Declared manifest

helix-deps.yaml at the repository root (§11.4.31; gap G6 **CLOSED**, verified 2026-08-27, parses under `yaml.safe_load`). It declares own-org dependencies only — a third-party gitlink is recorded there as a **comment**, never a deps entry (Constitution.md, superspec exclusion, point 4).

Toolchains the gates require (CI-matched)

Tool	Version	Used by
Go	1.26	<code>_tools/gen</code> unit tests + generator build (<code>_tools/gen/go.mod</code>)
Node	20	<code>_tests</code> Playwright harness
Ruby + Bundler	3.3	<code>milosvasic.ru</code> Jekyll build
poppler-utils	—	export gate: pdftotext, pdfimages, pdftoppm
tesseract-ocr	—	export gate: OCR layer

If poppler/tesseract are missing, gate 5 **degrades to a reasoned SKIP** rather than failing (README.md:50-52). Missing pandoc/weasyprint makes `deploy-langs.sh` warn and skip the PDF build — never fake an artifact.

Node packages (`_tests/package.json`, private, not published)

- `@playwright/test ^1.61.0 (dev)`
- `pixelmatch ^7.2.0`, `pngjs ^7.0.0 (dev)` — visual diffing
- `@axe-core/playwright ^4.11.3 (runtime dep)` — a11y audits

Install path: `npm ci` then `npx playwright install chromium` inside `_tests/`.

Go module

module `vasic.digital/tools/gen`, go 1.26. Sources: `main.go`, `data.go`, `home.go`, `il8n.go`, `markdown.go`, `portfolio.go`, `product.go`, `seo.go`, `shells.go` with table tests alongside. Python helpers in the same directory handle UI-string translation/review (`translate_ui_*.py`, `review_ui_*.py`, `merge_ui.py`, `audit_ui_glossary.py`).

Design system assets

Self-hosted only, no CDN: OFL 1.1 `.woff2` families under `design-system/fonts/` (Inter, JetBrains Mono, Bricolage Grotesque, Anton, Fraunces) and a local SVG sprite at `design-system/icons/icons.svg`. Generated with OpenDesign (github.com/nexu-io/open-design) — but OpenDesign is **not yet consumed as an external dependency**, which `_tests/GATES.md` records as an open \$11.4.162 gap.

Agent / semantic tooling (host-level, not repo-level)

- **Lumen** — MCP semantic search. Not an npm package: it ships as a Claude Code plugin binary resolved at call time by a version-agnostic wrapper at `~/.local/bin/lumen` (sort -V, so `0.0.100` outranks `0.0.9`). Override with `LUMEN_BIN`.
- **ollama** — local embedding backend. Model `ordis/jina-embeddings-v2-base-code` (~320 MB), set in `scripts/lumen-reindex.sh:45` and `scripts/setup-agents-wizard.sh:204`, overridable via `LUMEN_EMBED_MODEL`.
- **CodeGraph** — `@colbymchenry/codegraph` (npm), SQLite graph at `.codegraph/codegraph.db`. Refresh with `codegraph sync`; `codegraph init` only when no DB exists. **Never codegraph index** — it discards the DB.
- Also wired by the wizard: Bun, Glyphdown, SpecKit (`uv tool install specify-cli` — a Python tool, not npm), `ashlr-plugin`, optional WOZCODE.

- A Vulkan/Intel-iGPU remediation runbook exists at docs/setup-agents-wizard/OLLAMA-REMEDIATION.md (+ scripts/ollama-vulkan-remediation.sh).

Hosting contract

GitHub Pages, static file hosting. Consequences recorded in _tests/TEST-TYPES.md: **no response-header control** (so CSP exists only as a <meta> tag and is checked that way; HSTS/WAF are N/A), no origin server, no database, no runtime state.

Credentials

Never tracked. .gitignore blocks .mcp.json, .env/*.env/.env.*, api_keys.sh, secrets.sh, *.pem, *.p12, and ssh key patterns at any depth (§11.4.10).
