Auto-discovered from child directories at genome init, then extended by hand with what each repository IS and where it pushes. Remote data verified with `git -C <path> remote -v` on 2026-08-27; it matches the table in Constitution.md (“Project-specific remotes”, captured 2026-08-26).

- **Total directories:** 30
- **Git repositories:** 5 discovered as child checkouts (+ 2 under submodules/)
- **Projects with CLAUDE.md or .claude/:** 5

The gitlink set (.gitmodules, 7 entries)

Path	What it IS	Owned?
vasic.digital	Company site — committed static HTML , served as-is, no build step. Output of <code>_tools/gen/</code> .	Yes
milosvasic.ru	Personal site — Jekyll source ; rendered <code>_site/</code> is git-ignored. Embeds <code>red-elf/Upstreamable</code> (third-party, 0-byte gitlink → breaks recursive checkout).	Yes
design-toolkit	Deterministic, license-clean design-capability layer over OpenDesign. Self- declared “FIRST	Yes

Path	What it IS	Owned?
	INCREMENT — review-ready local scaffold ; generator code specified but not vendored. No CI gate reads it.	
ai_interviewing	Interview-preparation corpus + employer due-diligence kit for a specific role, exported to the four Constitution-mandated formats. Content, not code.	Yes
monetization	“Monetization of existing projects” (its whole README body). Docs + repos.txt.	Yes
submodules/constitution	HelixDevelopment/ HelixConstitution — the governance submodule this project consumes. Own-org, but deliberately carved out of §4 tag mirroring.	Governance
submodules/superspec	WangX0111/superspec — THIRD-PARTY , outside every operator-listed org. Never tagged, never given a carrier, never edited (Constitution.md §103).	No

Owned set per Constitution.md: ai_interviewing, design-toolkit, milosvasic.ru, monetization, vasic.digital.

Remote fan-out (verified 2026-08-27)

Repo	Distinct push URLs	Detail
main vasic	1	origin, github, upstream all ↔ git@github.com:milos85vasic/ vasic.git
ai_interviewing	1	three names, one URL (milos85vasic/ ai_interviewing)
vasic.digital	1	three names, one URL (vasic-digital/vasic- digital.github.io)
design-toolkit	1	origin only (vasic-digital/ design-toolkit)
milosvasic.ru	2	⚠ fetch/push asymmetry — see below
monetization	4	origin push → gitflic, github, gitlab, gitverse (ssh://...:2222). Named peers gitflic/github/gitlab/ gitverse, upstream ↔ gitflic
submodules/ constitution	6	origin push → gitflic, github, gitlab, gitverse, plus vasic-digital/ HelixConstitution on GitHub and GitLab. Named peers incl. vasic_digital_github, vasic_digital_gitlab
submodules/ superspec	1	third-party; this project pushes nothing here

All remotes are SSH. Not one https:// remote exists in the set.

Four repos have exactly one distinct URL — a GitHub outage makes the umbrella, ai_interviewing, vasic.digital and design-toolkit unreachable. §2.1 is a SHOULD for consuming projects, so this is a recorded posture, not a violation.

⚠ milosvasic.ru — fetches from a URL it never pushes to

```
origin  fetch  git@github.com:milos85vasic/milosvasic.ru.git
origin  push   git@gitflic.ru:milosvasic/milosvasic-net-v-2.git
origin  push   git@github.com:milos85vasic/milosvasic.net.v2.git
```

milosvasic.ru.git is in **no** remote's push list. .gitmodules pins the submodule URL to that same fetch-only repository, so a fresh git submodule update --init clones the repo that receives **no** pushes — a fresh clone and a long-lived working tree can be looking at different histories. Reconciling it is an **operator decision** (add the URL to origin's push list, or repoint fetch/.gitmodules at milosvasic.net.v2); it is never normalised from here. Full write-up: Constitution.md, "⚠ Hazard" subsection.

Local-only directories (no remote)

_analysis, _content + 14 _content_<lang> siblings
(ar be de es fa fr hi ja kk ko ru sr tr zh), _tests, _tools, data,
design-system, docs, scripts, submodules, tests, upstreams.

Carriers in the child repos

All five owned submodules carry a CLAUDE.md opening with ## INHERITED FROM constitution/CLAUDE.md and a **conditional** inheritance preamble ("The inheritance below is conditional. Both cases are stated; neither is assumed"). Note the path form there is constitution/, not this repository's submodules/constitution/.

Governance-carrier propagation to the owned submodules is **staged, not applied**: drafts live at docs/constitution-adoption/propagation/<submodule>/*.staged and the operator applies them per docs/constitution-adoption/propagation/APPLY.md (Constitution.md §102; gap G7 OPEN).
