

execute

speckit.superspec.execute

Orchestrate implementation with TDD, subagents, and review gates.

Usage

```
/speckit.superspec.execute [spec-number|spec-path]
```

Process

1. Read the tasks file for the target feature
2. Read the plan and constitution for context
3. **Superpowers detection:** Check for executing-plans, subagent-driven-development, and test-driven-development skills
4. Walk through tasks phase by phase:

For [TDD] tasks:

- If TDD skill found, follow its RED-GREEN-REFACTOR process
- Otherwise: write test → verify it fails → implement → verify it passes → refactor

For [SUBAGENT] tasks:

- If subagent-driven-development skill found, follow its dispatch protocol
- Otherwise: implement sequentially in-session

For [P] tasks:

- Launch parallel tasks where possible using the Task tool

For [REVIEW] tasks:

- Pause and run review protocol (see `commands/review.md`)

5. At each **phase checkpoint**:

- Summarize completed work
- Run tests if applicable
- Ask user for approval before proceeding to next phase

6. Update task checkboxes in `tasks.md` as each task completes

7. Update `specs/NNN/progress.yml` with current execution state

Output

Code changes in the project, updated task checkboxes in `tasks.md`.

Human Checkpoints

The agent **MUST** pause at every phase boundary and wait for explicit user approval. Never skip a checkpoint.

Superpowers Adaptation

Skill	Adaptation
executing-plans	Follow its batch processing protocol with human checkpoints
subagent-driven-development	Follow its dispatch protocol for [SUBAGENT] tasks
test-driven-development	Follow its RED-GREEN-REFACTOR discipline for [TDD] tasks

If no superpowers are available, all three fall back to built-in sequential execution with manual confirmation. See `references/superpowers-bridge.md` for full details.
