

after-execute

Hook: after_implement

Runs after `/speckit.implement` completes a phase or the entire execution. Requires evidence before completion claims are accepted.

Checks

1. **Evidence verification:** For each completed task, verify that the expected output exists (tests pass, files created, etc.)
2. **Test results:** If tests were run, verify they pass
3. **Progress update:** Update `specs/NNN/progress.yml` with completed tasks and current phase status
4. **Review suggestion:** If all tasks in a phase are complete, suggest running `/speckit.superspec.review` before proceeding to the next phase

Gate

Cannot mark a task as complete without evidence. Cannot advance to the next phase without explicit human approval at the checkpoint.
