

review

speckit.superspec.review

Run code review against spec requirements using review skills.

Usage

```
/speckit.superspec.review [scope]
```

Scope: Optional file paths, spec number, or “all changes”. Defaults to the latest feature.

Process

1. Read the spec and plan for the feature being reviewed
2. **Superpowers detection:** Check for requesting-code-review skill
 - **If found:** Read the skill and follow its pre-evaluation checklist and review dispatch protocol
 - **If not found:** Use the built-in review protocol below
3. Built-in review protocol:
 - **Spec compliance:** Verify each acceptance scenario from the spec is implemented
 - **Edge case coverage:** Verify brainstormed edge cases are handled
 - **Constitution compliance:** Check all governance principles are respected
 - **Code quality:** Check for bugs, security issues, error handling
 - **Test coverage:** Verify tests exist for critical paths
4. Report findings with confidence scores (0-100, only report issues ≥ 80)
5. Group findings by severity: Critical > Important > Suggestion

Output

Review findings reported to user. Optionally written to specs/NNN-feature-name/checklist-review.md.

Finding Format

Each finding includes: - Clear description with confidence score - File path and line reference - Specific recommendation or fix suggestion

Findings below 80 confidence are suppressed to reduce noise.

Superpowers Adaptation

When using the `requesting-code-review` skill, adapt its outputs: - Add superspec-specific review dimensions: spec compliance, constitution compliance, brainstorm coverage - Output location → report to user, optionally write to checklist file

See `references/superpowers-bridge.md` for full adaptation rules.
