Superspec Landing Page Constitution

Core Principles

I. Zero Build, Zero Runtime Dependencies

The landing page **MUST** be authored as raw HTML and CSS with no build tooling, no transpilation, no bundling, and no runtime dependency on external resources. Every byte required to render the page **MUST** be contained within the single output file or inlined assets.

Rationale: A landing page for a spec-kit tool should embody the simplicity it advocates. Zero build eliminates CI complexity, deploy friction, and supply-chain risk. Zero runtime deps guarantees the page loads even on restricted networks.

II. Semantic HTML First

All markup **MUST** use semantically appropriate HTML5 elements (`<header>`, `<nav>`, `<main>`, `<section>`, `<article>`, `<footer>`, etc.). Presentational `<div>` or `<span>` elements **MUST NOT** be used where a semantic element exists. Heading hierarchy **MUST** be strictly sequential without skipping levels.

Rationale: Semantic HTML is the foundation of accessibility, SEO, and maintainability. It communicates structure to assistive technology and search engines without relying on class-name conventions.

III. Mobile-First Responsive Design

Layouts MUST be designed for the smallest viewport first (≥ 320 px) and progressively enhanced for wider screens via CSS media queries. Touch targets MUST be at least 44×44 px. Text MUST remain readable without horizontal scrolling at any viewport width.

Rationale: Mobile-first is the correct default for a page whose audience includes developers browsing on phones during conferences or commutes. Progressive enhancement avoids desktop-centric assumptions.

IV. Self-Contained Single-File Delivery

The sole deliverable MUST be `web/index.html`. All styles MUST be inlined in a `<style>` tag within the document. Images MUST be inlined as data URIs or replaced with pure-CSS alternatives. No `<link>`, `<script src>`, or `<img src>` pointing to external resources is permitted.

Rationale: A single file simplifies deployment (drop it on any static host), eliminates CDN outages, and guarantees offline rendering.

V. Developer-Audience Clarity

Content and visual hierarchy MUST prioritize what a developer evaluating spec-kit extensions needs: what superspec does, how to get started, and where to find deeper documentation. Marketing language MUST be avoided in favor of concrete, technical descriptions. Code snippets and CLI examples SHOULD appear where they reduce ambiguity.

Rationale: The audience is technically discerning. Vague or promotional copy erodes credibility; precise, example-driven content builds trust.

Quality Standards

- **HTML Validation:** The output MUST pass the W3C Markup Validation Service with zero errors (warnings acceptable).
- **Responsive Verification:** The page MUST be verified at 320 px, 768 px, and 1280 px viewport widths with no layout breakage or horizontal overflow.
- **Accessibility Baseline:** The page MUST pass axe-core automated checks at zero violations. Color contrast MUST meet WCAG AA (4.5:1 for normal text, 3:1 for large text).

- **Page Weight:** Total transferred size of web/index.html MUST NOT exceed 64 KB (uncompressed).
- **Zero Console Errors:** Opening the page in a browser MUST produce zero console errors or warnings.
- **Offline Functional:** The page MUST render correctly when opened from a local file with no network connection.

Constraints

- **Technology:** Pure HTML5 + CSS3 only. JavaScript MUST NOT be used. CSS features limited to those with baseline support in the latest two major versions of Chrome, Firefox, Safari, and Edge.
- **Build Tooling:** None. No pre-processors (Sass, PostCSS), no templating engines, no static site generators. Files are authored and deployed as-is.
- **Output Path:** web/index.html — a single file at the project root under web/. No subdirectories, no asset folders.
- **External Network Dependencies:** None at runtime. No CDN links, no web fonts, no analytics scripts, no third-party resources of any kind. System font stacks MUST be used.
- **Browser Support:** Last two major versions of Chrome, Firefox, Safari, and Edge. Graceful degradation is acceptable; feature parity is not required for Internet Explorer or legacy EdgeHTML.

Governance

This constitution is the authoritative reference for all design and implementation decisions on the Superspec Landing Page. When a conflict arises between this document and any other artifact (spec, plan, tasks), the constitution prevails.

Amendment Procedure: 1. Propose amendment with written rationale. 2. Validate that the change does not violate an existing principle without explicit justification recorded in the Complexity Tracking section of the active plan. 3. Increment version per semantic versioning: - MAJOR: principle removal or redefinition - MINOR: new principle or materially expanded guidance - PATCH: clarification, wording, typo fixes 4. Update all dependent templates (plan, spec, tasks) to reflect the amendment before merging.

Compliance Review: Every implementation task MUST include a constitution compliance check before marking the task complete.

Version: 1.0.0 | **Ratified:** 2026-05-30 | **Last Amended:** 2026-05-30
