

plan

Implementation Plan: Static Landing Page

Branch: 001-static-landing-page | **Date:** 2026-05-30 | **Spec:** [spec.md](#)

Input: Feature specification from /specs/001-static-landing-page/spec.md

Summary

Build a single-file static landing page (web/index.html) for SuperSpec using pure HTML5 + CSS3 with zero build tooling, zero JavaScript, and zero external dependencies. The page comprises three sections: a full-viewport hero with project name/tagline/CTA, a features grid showcasing the five core commands, and a workflow diagram with install snippet. All styles are inlined; all content is semantic and mobile-first responsive.

Technical Context

Language/Version: HTML5 + CSS3 (no JavaScript)

Primary Dependencies: None (self-contained single-file delivery)

Storage: N/A

Testing: Manual browser testing at 320px/768px/1280px viewports, W3C Markup Validation (zero errors), axe-core accessibility audit (zero violations), wc -c page weight check (≤ 64 KB), print preview verification

Target Platform: Web browsers — Chrome, Firefox, Safari, Edge (last 2 major versions)

Project Type: Static web page (marketing/landing page)

Performance Goals: ≤64 KB uncompressed page weight, zero console errors, instant render (no JS to block)

Constraints: Single file (web/index.html), no external resources, no JavaScript, no build tools, WCAG AA color contrast, keyboard navigable, file:// protocol compatible, print stylesheet required

Scale/Scope: Single page, 3 content sections, ~18 functional requirements

Constitution Check

GATE: Must pass before Phase 0 research. Re-check after Phase 1 design.

Pre-Design Gate ✓

Principle	Status	Evidence
I. Zero Build, Zero Runtime Dependencies ✓	PASS	Spec mandates pure HTML+CSS with no build tooling or runtime deps (FR-010)
II. Semantic HTML First ✓	PASS	Spec requires landmark regions, sequential heading hierarchy, semantic elements (FR-016, edge cases)
III. Mobile-First Responsive Design ✓	PASS	Spec requires 320px+ support with progressive enhancement (FR-012, FR-013)
IV. Self-Contained Single-File Delivery ✓	PASS	Spec requires web/index.html as sole deliverable with inlined styles (FR-011, FR-015)
V. Developer-Audience Clarity	PASS	Spec prioritizes technical content — command descriptions, install snippet, workflow diagram

Result: All 5 principles pass. No violations to track.

Post-Design Gate (re-check after Phase 1)

Principle	Status	Evidence
I. Zero Build, Zero Runtime Dependencies	PASS	Design uses no build tools, no JS, no CDN links, no external resources
II. Semantic HTML First	PASS	Design specifies <header>, <main>, <section>, <footer>, for workflow, <code> for snippet
III. Mobile-First Responsive Design	PASS	Design uses mobile-first CSS with min-width breakpoints at 768px and 1024px
IV. Self-Contained Single-File Delivery	PASS	All CSS inlined in <style> tag; system font stack (no web fonts); CSS-only step indicator (no images)
V. Developer-Audience Clarity	PASS	Content is concrete and technical: command names, descriptions, install command, workflow sequence

Result: All 5 principles pass post-design. No violations.

Project Structure

Documentation (this feature)

```
specs/001-static-landing-page/
├─ spec.md           # Feature specification
├─ plan.md           # This file
├─ research.md       # Phase 0 output – resolved open
questions
├─ data-model.md     # Phase 1 output – content entities
├─ quickstart.md     # Phase 1 output – dev workflow
└─ tasks.md          # Phase 2 output (/speckit-tasks – NOT
created by /speckit-plan)
```

Source Code (repository root)

```
web/  
└─ index.html          # The entire deliverable – single file,  
all HTML + inlined CSS
```

Structure Decision: Single-file output per Constitution Principle IV. No `src/`, `dist/`, `assets/`, or build directories. The `web/` directory contains exactly one file: `index.html`.

Technical Approach

HTML Structure

```
<!DOCTYPE html>  
<html lang="en">  
<head>  
  <meta charset="UTF-8">  
  <meta name="viewport" content="width=device-width, initial-  
scale=1.0">  
  <title>SuperSpec – Specification-Driven Development</title>  
  <style>/* All CSS inlined here */</style>  
</head>  
<body>  
  <header>          ← Hero section (h1, tagline, CTA button)  
  <main>  
    <section>        ← Features grid (5 cards in CSS Grid)  
    <section>        ← Workflow diagram (ordered list step  
indicator) + install snippet  
  </main>  
  <footer>          ← Minimal footer  
</body>  
</html>
```

CSS Architecture

1. **Reset/Base:** Minimal CSS reset (box-sizing, margin/padding normalization)
2. **Typography:** System font stack with `clamp()` for responsive font sizing
3. **Layout:** Flexbox for hero and workflow; CSS Grid for features card layout
4. **Components:** `.card`, `.step-indicator`, `.code-block` utility classes
5. **Responsive:** Mobile-first with `@media` (min-width: 768px) and `@media` (min-width: 1024px)
6. **Accessibility:** `:focus-visible` outlines, forced-colors media query adjustments

7. **Print:** @media print — suppress decorative elements, linear flow, serif font

Workflow Diagram (Step Indicator)

- Semantic `<ol>` with 5 `<li>` items (one per command)
- CSS Flexbox for horizontal layout on wider viewports; vertical stack on mobile
- Each step: numbered circle (`::before` pseudo-element with counter) + command name
- Connecting line between steps via `::after` pseudo-element (border-based)
- Last step has no connecting line

Features Grid

- CSS Grid: `grid-template-columns: 1fr` on mobile → `repeat(2, 1fr)` at 768px → `repeat(3, 1fr)` at 1024px
- Cards use semantic `<article>` elements with `<h3>` command name and `<p>` description
- Second row centers the remaining 2 cards using flexbox wrapper or grid placement

Key Design Decisions

Decision	Choice	Rationale
“Get Started” destination	<code>#install</code>	Scrolls to install section; no external URL available yet (OQ-001)
Install command	<code>npm install -g superspec</code>	Standard for developer CLI tools; confirm before production (OQ-002)
Workflow diagram style	Step indicator (numbered circles + connecting lines)	Lightweight, consistent rendering, accessible (OQ-003)
Font strategy	System font stack	No external deps per Constitution I & IV
Layout mechanism	Flexbox + CSS Grid	Baseline-supported in all target browsers
Responsive breakpoints	768px, 1024px (mobile-first)	Covers tablet and desktop; aligns with Constitution III

Risks

Risk	Likelihood	Impact	Mitigation
Page weight exceeds 64 KB	Low	High	Step indicator pattern chosen over CSS arrows for weight efficiency; monitor with wc -c during development; simplify typography/layout rules if needed
CSS rendering inconsistencies across browsers	Low	Medium	Use only baseline CSS features (flexbox, grid, clamp()); test in all 4 target browsers
“Get Started” link points to placeholder	Medium	Low	#install provides functional in-page navigation; destination URL is trivially updatable
Install command incorrect	Medium	Low	npm install -g superspec is the assumed default; must be confirmed before deployment
Print stylesheet breaks layout	Low	Medium	Dedicated @media print block with explicit overrides; verify with Print Preview in all target browsers
Forced-colors mode removes visual distinction	Low	Medium	Use forced-colors media query to add explicit borders; never rely on background-color alone per FR-018

Complexity Tracking

| No constitution violations. This section is empty.
