

github-helix-others

Helix / Server-Factory GitHub Org Inventory

Generated 2026-06-17 from live gh CLI calls (account milos85vasic). Every number below comes from a real command (gh repo list ... --json, gh api repos/<org>/<name>/readme, gh api repos/<org>/<name>/languages). Source data: github-helix-others.json.

Counts

Org	Repos
HelixDevelopment	30
Helix-Track	13
Helix-Flow	1
Server-Factory	12
Total	56

Flag totals (across all 56 repos):

- **Forks:** 11 — 1 in Helix-Track (Website-Theme-Jekyll), 10 in Server-Factory (Docker-Definitions, Mail-Server-Factory, Core-Framework, Stack-Definitions, Software-Definitions, Utils, Qemu-Utils, Parallels-Utils, SonarQube-Factory, Web-Service-Factory).
- **Archived:** 4 — HelixDevelopment/Helix-Game-Demo, HelixDevelopment/Stake-Tetris, HelixDevelopment/Helix-Game-1, Helix-Track/Legacy-Project.
- **Private:** 12 — 3 in HelixDevelopment (the 3 game repos above) and 9 in Helix-Track (Everything, iOS-Client, Android-Client, Desktop-Client, Web-Client, Aurora-Client, Harmony-OS-Client, Legacy-Project, Proprietary).

Per-org fork/archived/private breakdown:

Org	Forks	Archived	Private
HelixDevelopment	0	3	3
Helix-Track	1	1	9
Helix-Flow	0	0	0
Server-Factory	10	0	0

All Repositories (sorted by disk usage, DESC)

TOP 15 DEEP DIVE

Sizes are GitHub diskUsage (KB). Language splits are byte counts from `gh api .../languages` (top languages shown). Summaries are derived from each repo's actual README.

1. HelixDevelopment/HelixCode — 1,463,623 KB (Go)

Languages: Go 18.5M, HTML 2.4M, Shell 1.1M, JavaScript 126K, CSS 103K, + Swift/Kotlin/Python/Ruby/PowerShell. Enterprise-grade distributed AI **coding agent / development platform** (`dev.helix.code`, MIT). Provides intelligent task division with work preservation, JWT auth, distributed worker management/health monitoring, automatic checkpointing/rollback, a Gin REST API, and multi-provider LLM integration (Llama.cpp, Ollama, OpenAI). The largest repo in the fleet.

2. HelixDevelopment/HelixTranslate — 1,088,760 KB (Go)

Languages: Go 5.1M, HTML 1.5M, Shell 546K, Python 48K, + JS/CSS/Make/Docker. A high-performance, enterprise-grade **universal ebook/translation toolkit** plus a real-time WebSocket translation-monitoring system. Supports any ebook format and any language pair, multiple translation engines, a REST API with HTTP/3, SSH worker integration, and an interactive web dashboard.

3. HelixDevelopment/HelixAgent — 918,896 KB (Go)

Languages: Go 28.7M, Shell 6.7M, HTML 2.4M, TypeScript 1.1M, Python 636K, JS 319K, Rust 317K, PLpgSQL 276K, + more. Production-ready, AI-powered **ensemble LLM service** (MIT) that intelligently combines responses from multiple language models for the most accurate/reliable output. Docker-first with AI and monitoring profiles. This is the central "AI debate ensemble" consumer that several smaller libraries feed into (HelixMemory, HelixSpecifier, DebateOrchestrator).

4. HelixTrack/Core — 311,522 KB (Go)

Languages: Go 5.1M, HTML 1.7M, Shell 399K, PLpgSQL 62K, Python 14K, Docker 4.6K. **HelixTrack Core** — the production-ready, extreme-performance REST API microservice for project/issue tracking; a modern open-source **JIRA alternative** built with Go + Gin. Claims 50,000+ req/s with sub-millisecond response,

full issue tracking, agile/scrum, team management, a hierarchical permissions engine, and SQLCipher encryption. This is the core of the Helix-Track product.

5. HelixDevelopment/Helix-Game-Demo — 86,322 KB (TypeScript, archived/private)

Languages: TypeScript 31.5M, Svelte 529K, + JS/HTML/CSS/SCSS. A **web game SDK** for building games declaratively, intended for launching games on Stake Engine. Powered by Svelte 5, PixiJS 8, and TurboRepo. Archived demo/template.

6. Helix-Flow/Platform — 76,854 KB (Go)

Languages: Go 335K, Python 334K, Shell 320K, HTML 77K, JS 26K, PLpgSQL 20K, HCL 19K, Mermaid 15K. **“One Platform for all your AI inference needs”** — described as running AI models faster and at any scale with predictable costs. The polyglot mix (Go + Python + Terraform/HCL) suggests an inference platform with IaC-managed deployment. The only repo in the Helix-Flow org; README is minimal (a tagline).

7. HelixDevelopment/helix_ota — 71,406 KB (Go)

Languages: Go 595K, Shell 430K, TypeScript 238K, HTML 15K, Batchfile 6K, Docker 3K. **Helix OTA** — a universal, decoupled over-the-air update system: a Go control plane plus per-OS client SDKs/agents. First target is Android 15 on Orange Pi 5 Max. Currently in specification/research phase; it is the umbrella for the six ota-* submodule repos.

8. HelixDevelopment/helix_cluster — 61,513 KB (Go)

Languages: Go 15.4M, TLA+ 316K, Shell 87K, PLpgSQL 55K, Python 42K, TypeScript 26K. **Helix Cluster OS** — a next-generation distributed operating system orchestrating compute across heterogeneous nodes (datacenter GPUs down to edge SBCs/handhelds). Unifies HPC scheduling, container orchestration, AI/ML inference, federated multi-cluster operation, and secure multi-tenant sessions under one control plane, with an Omega-model pluggable scheduler. (Note the TLA+ formal-spec presence.)

9. HelixDevelopment/HelixConstitution — 61,241 KB (HTML)

Languages: HTML 2.4M, Go 297K, Shell 177K, Python 94K. The **universal engineering constitution** shared by every Helix project as a Git submodule — project-agnostic rules, constraints, and conventions (AGENTS.md / CLAUDE.md / QWEN.md). Includes a submodules-catalogue.md enumerating ~142 owned repositories. This is the governance backbone of the entire family.

10. HelixDevelopment/HelixPlay — 59,224 KB (Go)

Languages: Go 500K, Shell 99K, PowerShell 24K, Make 6K, JS 3K, Dart 2K, Docker 2K. **HelixPlay** — turns any GPU-equipped machine into a remote **cloud-gaming appliance**, streaming console-class experiences at $\leq 30\text{ms}$ LAN / $\leq 50\text{ms}$ WAN p999 latency. Self-hostable, open, and white-labellable for partners; composed of 46 submodules.

11. HelixDevelopment/helixqa — 24,704 KB (Go)

Languages: Go 5.2M, Shell 136K, TypeScript 17K, JS 12K, Make 4K, Docker 4K. **HelixQA** — an “anti-bluff” QA orchestration framework for cross-platform testing: real-time crash detection, step validation, evidence collection, and automated ticket generation. Governed heavily by the constitution’s CONST-* clauses; consumes the digital.vasic.challenges infrastructure.

12. HelixTrack/Everything — 21,700 KB (Shell, private)

Languages: Shell 69K, Kotlin 22K, HTML 20K. **Wrapper/umbrella repository** that aggregates all HelixTrack projects (repositories) — a meta-repo (likely submodule aggregator) rather than a standalone product. README is one line.

13. Server-Factory/Mail-Server-Factory — 11,584 KB (Shell, fork)

Languages: Shell 454K, Kotlin 179K, Docker 7K, C++ 1K, Sieve 633. **Mail Server Factory** — “Run Your Mail Server Like The Boss.” A production-ready automated mail-server provisioning/installation tool supporting 12 connection types (SSH, Docker, Kubernetes, AWS SSM, Azure, GCP, Libvirt, etc.), a full security framework, and 439 passing tests. Flagship of the Server-Factory org.

14. HelixDevelopment/LLMOrchestrator — 8,658 KB (HTML)

Languages: HTML 1.3M, Go 555K, Shell 42K, Make 2K.
Standalone Go module (digital.vasic.llmorchestrator) for **managing headless CLI agents** (OpenCode, Claude Code, Gemini, Junie, Qwen Code) via a hybrid pipe+file protocol, with a decoupled i18n.Translator abstraction. Shared infrastructure consumed by multiple Helix projects; emphasizes “anti-bluff” guarantees. (Large HTML byte count is generated docs.)

15. Server-Factory/Mail-Server-Factory-Website — 6,326 KB (Shell)

Languages: Shell 214. The **GitHub Pages website** for the Mail Server Factory project; actual site source lives on the gh-pages branch. Pure documentation/site repo.

PRODUCT FAMILY NOTES

These orgs form one tightly-coupled, submodule-driven engineering ecosystem authored by the same owner (milos85vasic / package roots dev.helix.* and digital.vasic.*). The architecture is “constitution + many decoupled reusable submodules consumed by a few large product apps.”

Governance core (the spine): - **HelixConstitution** is the universal rulebook included as a Git submodule by every project (AGENTS.md / CLAUDE.md / QWEN.md, CONST-* clauses, a ~142-repo submodules-catalogue.md). It is what makes the family coherent. The recurring “anti-bluff,” “no-fakes,” “100% test-type coverage,” and “submodules-as-equal-codebase / decoupling” themes seen across HelixAgent, HelixQA, LLMOrchestrator, and helix_cluster all trace back to it.

Flagship product apps (the large repos): - **HelixAgent** — the AI ensemble LLM service; the central brain that the AI/agent tooling plugs into (“AI debate ensemble”). - **HelixCode** — distributed AI coding-agent platform. - **HelixTranslate** — universal translation/ebook toolkit + real-time monitoring. - **HelixTrack/Core** — the JIRA-alternative issue tracker (its own product line with many clients). - **HelixPlay** — self-hostable cloud-gaming platform (46 submodules). - **helix_cluster (Helix Cluster OS)** — distributed OS / scheduler that can host the inference and compute workloads. - **helix_ota (Helix OTA)** — universal OTA update system (control plane + clients). - **Helix-Flow/Platform** — unified AI-inference platform (the org has only this one repo; positioned as the inference/serving layer).

Shared/reusable libraries (small repos, consumed as submodules by the apps above): - **LLMProvider** (40+ provider adapters), **LLMOrchestrator** (headless CLI-agent management), **HelixLLM** (local model), **HelixMemory** (Mem0+Cognee+Letta memory engine for HelixAgent), **HelixSpecifier** (spec-driven-dev fusion for HelixAgent), **DebateOrchestrator** (multi-agent debate library), **DagOrchestrator** + **PipelineRuntime** (dataflow/DAG runtimes), **VisionEngine** (CV/LLM vision for UI), **HelixGitpx** (git proxy), **HelixBuilder** (AI build pipeline). - **QA stack: helixqa** (anti-bluff QA orchestrator) + **DocProcessor** (feature-map extraction for QA). - **OTA submodules:** the six ota-* repos (ota-protocol, ota-rollout-engine, ota-artifact-validator, ota-update-engine-bridge, ota-telemetry-schema, ota-android-agent) are the decomposed pieces of **helix_ota**.

Helix-Track product line (the issue tracker + its clients): - **Core** is the backend microservice. Around it sit per-platform **clients** — iOS-Client, Android-Client, Desktop-Client, Web-Client, Aurora-Client, Harmony-OS-Client — plus Website, Website-Theme-Jekyll, Screensaver, Proprietary (proprietary components), Legacy-Project (archived predecessor), and Everything (umbrella/aggregator meta-repo). Most clients are private.

Server-Factory (infrastructure-provisioning sibling family): - A separate, mostly-fork-based Kotlin/Shell org for **server provisioning automation**. **Mail-Server-Factory** is the flagship product; **Core-Framework** is the shared engine; **Web-Service-Factory**, **SonarQube-Factory**, **Caching-Proxy-Factory** are per-service “factories”; **Stack/Software/Docker-Definitions** are declarative configuration packs; **Utils / Qemu-Utils / Parallels-Utils** are tooling. It predates the Helix work (2022–2023 timestamps on several repos) and is more of an adjacent toolchain than part of the AI product core.

Demos / games: Helix-Game-Demo, Stake-Tetris, Helix-Game-1 (all archived/private) are Stake-Engine game experiments, related to the gaming theme (HelixPlay, Helix-Game-Demo SDK) but not part of the production product line.

Summary of relationships: HelixConstitution = shared law → consumed by everything; a small set of large Go product apps (HelixAgent, HelixCode, HelixTranslate, HelixPlay, Helix-Track/Core, helix_cluster, helix_ota, Helix-Flow/Platform) compose dozens of small, deliberately-decoupled reusable submodule libraries. Helix-Track is its own product (tracker + many clients), and Server-Factory is an older, adjacent provisioning-automation toolchain.
