

REPRODUCTION-followup

a11y target-size findings — reproduction follow-up (2026-08-08, post-v1.7.2)

The a11y audit (axe-core) reported 3 target-size (WCAG 2.5.8) violations on milosvasic.ru: a.brand, and RTL #lang-btn/#theme-btn at “38×5.9px partiallyObscured”.

Reproduction (Playwright, live <https://milosvasic.ru/ar/>, systematic-debugging Phase 1): - Probed at 375 / 414 / 768 / 1280 px. At EVERY width, #lang-btn and #theme-btn measure a clean **38×38 px** and `elementFromPoint(center)` returns the button itself → **not obscured**, and $38 \geq$ the 24 px AA minimum → **PASS**. - .brand measures **114×24 px** — exactly at the 24 px threshold (borderline PASS).

Conclusion (no bluff): the reported RTL “5.9px partiallyObscured” does **not reproduce** on the current live site; it was an axe measurement artifact (adjacent-target spacing heuristic / transient render state), not a real usability defect. No fix applied — fixing an unreproducible finding would violate NO-FIX-WITHOUT-ROOT-CAUSE. Optional hardening only: `.brand{min-height:24px}` as a safety margin against the borderline case. vasic.digital remains 0 violations.
