

pdf-chrome-i18n-gap

PDF translation audit (#65) — 15 langs × {CV, Cover-Letter, Portfolio}

Method: `pdftotext -enc UTF-8` on every committed PDF, measuring (a) target-script ratio for non-Latin languages and (b) presence of hardcoded-English chrome strings. Full per-file table: `pdf-audit-matrix.txt`.

PASS / GAP matrix (45 personal PDFs; company Portfolio mirrors personal Portfolio)

Lang	script	CV	Cover-Letter	Portfolio
EN	latin	PASS	PASS	PASS
DE ES FR TR	latin	GAP-chrome	GAP-chrome	GAP-chrome
RU BE KK	cyrillic (body 0.71-0.78)	GAP-chrome	GAP-chrome	GAP-chrome
AR FA	arabic (body 0.69-0.75)	GAP-chrome	GAP-chrome	GAP-chrome
HI	devanagari (0.70-0.78)	GAP-chrome	GAP-chrome	GAP-chrome
JA KO ZH	cjk (0.44-0.66)	GAP-chrome	GAP-chrome	GAP-chrome

Lang	script	CV	Cover-Letter	Portfolio
SR (committed, stale)	cyrillic 0.000	FAIL→FIXED	FAIL→FIXED	FAIL→FIXED

- **Document BODY** is correctly translated + correct-script for ALL 14 non-EN languages (every `_content_<lang>/docs/{cv,cover-letter,portfolio}.md` exists — no EN fallback is triggered). Body script ratios clear their thresholds.
- **SR** was the only script FAILURE: the committed SR PDFs were built from the old Latin content (cyrillic ratio 0.000). After this task's content fix, a rebuild yields 0.72 / 0.77 / 0.74 (see `sr-pdf-rebuild-verification.txt`). The maintainer's regen will ship correct Cyrillic SR PDFs. **No further SR PDF action needed.**
- **GAP-chrome** = the ONLY remaining leak for the 13 other non-EN languages. It is NOT in the translated body — it is the PDF "chrome" hardcoded in `_tools/pdf/build-pdfs.sh` (cover page + metrics strip + Portfolio figures), which is emitted in English for every language.

Genuine content gap: hardcoded English chrome in build-pdfs.sh (#65)

These strings are literal English in the script and appear on every language's PDF. They are NOT sourced from `_content_<lang>` nor from `ui-i18n.*.json` (verified: the UI i18n set has no equivalent keys), so localizing them requires NEW translations.

CV cover/header/metrics: - eyebrow / running header: Curriculum Vitae - role: AI Engineer · Software Engineer - tagline: LLM infrastructure, autonomous agents, and the governance that makes them trustworthy. Fleets over monoliths; anti-bluff, evidence-gated quality. - metric labels: Engineering since, Repositories governed, LLM providers unified, Core languages

Cover-Letter cover/header: - eyebrow / running header: Cover Letter - role: Cover Letter · AI Engineer - tagline: Deep AI-systems engineering paired with a genuine, verifiable quality discipline.

Portfolio cover/header/metrics/figures: - eyebrow: Vasic Digital · Evidence-Based Portfolio - role (personal): Portfolio · Helix family · vasic-digital · Server Factory - role (company): AI-native software engineering · Evidence-based portfolio - running header: Portfolio - taglines (personal + company variants) — 2 long marketing sentences - metric labels: Repository fleet, LLM providers, Linux distros provisioned, Passing

tests · Mail Server Factory - figures heading: Selected architecture - 3 figure captions (HelixAgent / HelixCluster / LLMsVerifier) — dense technical prose

Also emitted in a Latin-safe font regardless of language.

Recommended fix (flagged for the translation pipeline — NOT fabricated here)

Per the Constitution translation mandate (container-only HelixTranslate + independent review; anti-bluff §11.4.6), these ~20 bespoke marketing/technical strings must be translated through the pipeline, not hand-invented. Suggested structural change for the maintainer:

1. Externalize the chrome strings from `build-pdfs.sh` into a per-language table (e.g. `_tools/pdf/pdf-i18n.json`, keyed `<lang>.<field>`), EN populated from the current literals.
2. Run the strings through HelixTranslate (protected terms already covered by `glossary.json`) + `review_translation.py` per language.
3. Have `build_html/build()` look up `<lang>` with EN fallback.

Scope note: fixing this correctly is a translation-pipeline deliverable spanning 13 languages; it is out of scope for a no-fabrication content pass and is flagged here with the exact string inventory so it can be executed cleanly.
