Hardcoded-Content Audit — The Rule + Design-System / Data-Model

READ-ONLY audit. No source edited. Scope: (A) constitution anti-hardcoding mandate; (B) design-system/**, the generator/data-loading layer, _content/**; (C) the intended data-model map. Date: 2026-08-07.

A. THE RULE — constitution anchors that mandate data-driven, non- hardcoded content

The Constitution (submodules/constitution/Constitution.md) has **no single “website copy must not be hardcoded” clause**; the mandate is **composed** from a small anchor family. The load-bearing anchors, quoted verbatim:

§11.4.35 — configuration/content supplied as DATA (the core “as data” anchor)

Recurring normative phrase across dozens of universal anchors: > “...the consuming project supplies its ... **as DATA per §11.4.35.**”
And e.g.: > “consumer-bound path **as DATA per §11.4.35**”

§11.4.35 is the generalized decoupling-to-data rule: project-specific values (paths, brand values, language sets, glossary, token values, copy) are **injected as data**, never baked in as literals. This is the anchor to cite for “content must live in data files, not hardcoded in templates/CSS/code.”

§11.4.216 — canonical machine-readable design-token source (anti-hardcoding for design values)

“§11.4.216 — canonical machine-readable design-token source: ONE CSS custom-property file (:root {} + [data-theme="dark"] override), **every platform consumes GENERATED bindings never hand-copies, no invented values** (§11.4.6 applied to design — every color traceable to eyedrop/measured-contrast evidence).”

“Never hand-copies, no invented values” = no hardcoded design literals; every value derives from the single token source.

§11.4.162 — OpenDesign is the MANDATED token system

“§11.4.162 (OpenDesign) ... OpenDesign is the mandated token SYSTEM” (and per the design-system README: “no ad-hoc CSS, no other token system”). §11.4.190 is the “strict WEB-quality expansion of §11.4.162 ... host-rendered pixel proof as the correctness oracle.”

§11.4.219 — real data, honesty markers, never a fake flow

“populated with **REALISTIC product data (never lorem-ipsum for load-bearing content)** ... where the backing backend, contract, or product decision does not exist, the screen MUST say so ... **NEVER a designed-as-if-real fake flow.**”

Load-bearing content must be REAL (from data), and gaps must be marked, not faked.

§11.4.237 / §11.4.140 / §11.4.141 — every localized string is data + independently reviewed

Every translated artifact (UI strings, pages, PDFs, “any localized content”) is produced by the canonical pipeline and independently reviewed; the consuming project “supplies its language set, term glossary, non-translatable token list ... **as DATA per §11.4.35.**” Implies: user-facing strings are dictionary entries (data), not literals in code.

Anti-bluff / evidence angle

- **§11.4.6** (honest boundary / no invented values) is explicitly “applied to design” inside §11.4.216 — a hardcoded/invented value is a §11.4.6 bluff.

- **§11.4.223** — provenance markers [VERIFIED]/[OPERATOR]/[DEFAULT]/[OPEN:id] for design docs; open items registered + tracked (§11.4.93/§11.4.197).
- A remediation for any finding below must land the fix as a tracked workable item with a RED→GREEN guard, not as prose (§11.4.202/§11.4.205) — “a rule that lives only in prose is re-learned per session and skipped under pressure.”

Citation for remediation: anchor the “no hardcoded content” requirement on **§11.4.35** (content/config as data) + **§11.4.216/§11.4.162** (design values as generated tokens, no invented values) + **§11.4.219** (real data / no fake) + **§11.4.6** (invented value = bluff).

C. DATA-MODEL MAP — how content is SUPPOSED to flow

The Go generator under `_tools/gen/` renders both sites from data. Anything content-bearing OUTSIDE this model is a candidate violation.

Data source	Feeds	Loader / type
<code>_content/portfolio/portfolio.json</code>	product metadata (name, slug, tier, status, license, tech, repos, summary, tagline) — “single source of truth for product metadata, shared by both sites”	<code>data.go Portfolio / loadPortfolio</code>
<code>_content/sites/<site>.home.json (+ .home.<lang>.json ×15)</code>	homepage content model — hero/section/contact blocks, prose, cards, stats, CTAs	<code>data.go HomeDoc / loadHome; rendered by home.go</code>
<code>_content/products/*.md (+ _content_<lang>/products/*.md)</code>	product detail pages (frontmatter + markdown body)	<code>data.go parseFrontmatter; product.go, markdown.go</code>
<code>_content/docs/*.md, _content/sites/*.md (+ _content_<lang>/...)</code>	CV / cover-letter / portfolio docs; per-site page shells	<code>markdown.go</code>
<code>_tools/gen/ui-i18n.json</code>	every generator-emitted UI/chrome + SEO string, ×15	<code>i18n.go T(lang, key)</code>

Data source	Feeds	Loader / type
(embedded via //go:embed)	languages; EN is source of truth, non-EN reviewer-gated (§11.4.140/141/236)	
design-system/brand-*/*.css (:root tokens)	all colors/spacing/type/motion; consumed only via var(--od-*)	linked/imported per surface
content<lang>/** (15 mirrors: ar be de es fa fr hi ja kk ko ru sr tr zh)	translated content, mirroring _content/{docs,products,sites} structure	same loaders, lang-suffixed

Correct pattern: **strings** → `T(lang, key)` (**ui-i18n.json**); **prose/cards/stats** → **home.json**; **product facts** → **portfolio.json** + **product.md**; **design values** → `var(--od-*)` **tokens**. A literal string in Go/CSS/HTML template that is visitor-facing prose and bypasses these = violation.

B. FINDINGS — design-system + generator + content

Design-system CSS — CLEAN of hardcoded prose (decorative only)

All content: declarations across design-system/**/*.css are **decorative**, not visitor-facing prose — NOT violations: - components-extended.css — content: ''/content: "" on ::before/::after (icons, rings, geometric marks): lines 396, 409, 458, 706, 1009. - brand-milosvasic/milosvasic.css:710,716 — content: "" decorative accent bar. - brand-vasic-digital/vasic-digital.css:396,562 — content: "" decorative. - motion/animations.css:119,154,172,277 — content: "" decorative. - **Borderline (LOW/none)**: components-extended.css:747 breadcrumb separator content: '/'. A structural separator glyph (chrome), not prose; standard practice. Note only — could be tokenized/localized if strictness demanded.

Other design-system surfaces: - design-system/components-extended.css — **0 raw hex colors**; 100% var(--od-*) (satisfies §11.4.216). GOOD. - design-system/icons/icons.svg — pure <symbol>/<path>, **no <text>**. GOOD. - design-system/motion/motion.js — no hardcoded user-facing prose; the count-up reads/writes numeric text from data-*/textContent only. GOOD. - design-system/preview/*.html, fonts/preview.html, motion/preview.html — contain

hardcoded English demo labels, but these are the **design-library catalogue / rendered proof fixtures** (§11.4.218), NOT shipped visitor content. EXPECTED — not violations.

Generator (`_tools/gen/**`) — content is data-driven; minor literals

F1 — LOW — hardcoded background:#fff in generator-emitted CSS. - Location: `_tools/gen/shells.go:32` (`.od-brand__logo`) and `:35` (`.vd-hero__logo img`); also the personal-brand `mvHeadStyle` uses white chips. - Literal: `background:#fff`. - Why a violation: §11.4.216 “no invented values” — a raw color literal in token-governed CSS instead of a `var(--od-*)` token (e.g. a `--od-surface-inv / logo-plate` token). Design value, not content. - Severity: LOW. Remediation: add a token for the logo/portrait plate color and reference it; or document as an intentional pure-white plate token.

F2 — LOW — hardcoded copyright year © 2026. - Location: `_tools/gen/i18n.go:154` (switcher footer dict) and `_tools/gen/product.go:244` (product page footer). (The standalone home footer uses `HomeDoc.Footer` from `home.json` — data-driven, OK.) - Literal: `"© 2026 "`. - Why a violation: a fixed datum baked into template/code that should be parameterized (build-time year or a data field) — will silently go stale; mild §11.4.35 (“as data”) + §11.4.6 (honesty/staleness) concern. - Severity: LOW. Remediation: derive the year at generation time or source from site data; keep `©/suffix` in the dict (suffix already is: `footer.suffix`).

F3 — LOW/INFO — status & tier VALUES emitted verbatim, not localized. - Location: `_tools/gen/product.go:162,173` — `<span class="od-badge--status od-badge--status--%s">%s</span>` with both `%s` = `esc(e.Status)`; the eyebrow emits `esc(e.Tier)` and `esc(e.License)` verbatim. - Literal: none in code — values come from `portfolio.json` (`status`, `tier`, `license`). So they ARE data-driven (compliant with §11.4.35), BUT the visible status/tier label text is the raw English value, identical across all 15 localized pages (the surrounding labels `prod.tier/prod.license/prod.order/prod.source` DO localize via `T()`). - Why noted: a **localization-completeness** gap (§11.4.237) rather than a hardcoding violation — human-readable status/tier prose is not run through the `i18n` dictionary. License string is correctly non-translatable (proper token). - Severity: LOW / INFO. Remediation (if desired): map status/tier codes to `T(lang, "status.<code>") / T(lang, "tier.<code>")` dictionary entries; keep `portfolio.json` as the code source.

Not a violation — t0r English fallbacks (home.go:401,404-406). `t0r(lang, "skip", "Skip to content")`, `nav.work→"Work"`, `nav.contact→"Contact"` look like hardcoded copy, but `i18n.go t0r` returns the fallback ONLY when the dictionary lacks the key. **Verified:** the embedded `ui-i18n.json` contains `skip`, `nav.work`,

nav.contact, nav.products, nav.portfolio, footer.suffix, aria.primaryNav, aria.backToTop, aria.toggleTheme for **all 15 languages** — so the literals are honest EN-source fallbacks that never surface, exactly the §11.4.35/§11.4.6 “degrade honestly to EN” pattern the code comments describe. GOOD. (Note: the sibling file `_tools/gen/ui-i18n.en.json` is MISSING nav.work/nav.contact/aria.* — but it is NOT the embedded/compiled dictionary; the `//go:embed ui-i18n.json` file is complete. `ui-i18n.en.json` appears stale/ secondary — worth a follow-up to reconcile or delete, low priority.)

`_content/**` — CLEAN

Structure matches the data model: `portfolio/portfolio.json`, `products/*.md`, `docs/*.md`, `sites/*.home[.<lang>].json` + `sites/*.md`, mirrored across 15 `_content_<lang>/` trees. No content-bearing literals outside the model observed.

CONSOLIDATED VIEW

ID	Severity	Location	Issue	Anchor
F1	LOW	<code>_tools/gen/shells.go:32,35</code> (+mv style)	<code>background:#fff</code> raw color literal in token- governed CSS	§11.4.216/ §11.4.6
F2	LOW	<code>_tools/gen/i18n.go:154,</code> <code>product.go:244</code>	hardcoded © 2026 year	§11.4.35/ §11.4.6
F3	LOW/ INFO	<code>_tools/gen/product.go:162,173</code>	status/tier values data- driven but not localized	§11.4.237
—	none	<code>design-system/**</code> CSS/JS/SVG	decorative content: only; 0 raw hex; no prose	(clean)
—	none	<code>home.go</code> t0r fallbacks	keys present ×15 in embedded dict; honest EN fallback	(clean)
note	INFO	<code>_tools/gen/ui-i18n.en.json</code>	stale/ secondary,	reconcile

ID	Severity	Location	Issue	Anchor
			missing keys; not compiled	

Bottom line: The design-system and the content pipeline are **substantially compliant** with the data-driven mandate. The token layer is clean (components-extended.css 0 raw hex; icons/motion no prose). All shipped visitor copy flows through ui-i18n.json (strings), *.home.json (prose/cards), and portfolio.json + product.md (facts). The only literals found are three LOW-severity items in the **generator** (a #fff plate color, a © 2026 year, and un-localized status/tier values) — none are hardcoded prose in shipped templates or CSS. Any remediation should land as tracked items with RED→GREEN guards, not prose (§11.4.202/§11.4.205).
