

v171-hardcoding-testbank

HelixQA Challenge Bank — v1.7.1 Hardcoded-Content Elimination (#67)

A HelixQA-style **Challenge bank** pinning the v1.7.1 “eliminate ALL hardcoded content” work on vasic.digital and milosvasic.ru against silent regression. It is the **spec** (what is checked, thresholds, evidence schema, golden-good / golden-bad mutations, executable-check column); the **runners** are:

- live: `../tests/v171-hardcoding.spec.js`, wired into `../playwright.live.config.js`, read-only against LIVE production:

```
cd _tests && npx playwright test v171-hardcoding.spec.js --  
config=playwright.live.config.js
```

- pre-deploy: `../_tools/audit-hardcoding.sh` — builds the generator with a **2099 sentinel year** and greps the output; exits non-zero on any violation.

```
bash _tools/audit-hardcoding.sh
```

Anti-bluff contract (§11.4.5 / §11.4.6 / §11.4.170): every PASS is backed by a **captured POSITIVE measurement**. Golden-BAD mutations prove each detector bites — all four gate detectors were verified to fire against injected violations (hardcoded © 2026 footer, EN summary leak, EN heading, transliterated लिन्क्स).

Localization / data mandate: enforces Helix Constitution **§11.4.140/141** (localized strings are DATA, no English leakage into a localized surface), **§11.4.216** (generated values, never invented/hardcoded), **§11.4.50** (render determinism — identical source ⇒ byte-identical output).

```
feature_class = v171_hardcoding. Evidence → _tests/evidence/  
hardcoded-audit-v171/.
```

Check class legend - RUN — executed live by v171-hardcoding.spec.js; real pass/fail, gating. - **GATE** — executed pre-deploy by audit-hardcoding.sh against a fresh build. - **SPEC** — declared threshold/mutation, enforced by the RUN/GATE check.

Live baseline: 14/14 PASS (Playwright, live) · **Gate: 4/4 PASS** (fresh build).

Challenge index

ID	Fix	Surface	Gate	Class	Live/ga measu
C67-FOOTER	deterministic © year (not hardcoded)	both home footers	© <year> Brand, year ≥ 2026; 2099-sentinel build = all footers © 2099	RUN+GATE	vasic & milos li © 2026 sentine build 100% © 2099
C67-BLK1	localized portfolio card blurbs	vasic / portfolio/ {de,ru}/	0 EN marketing- phrase leak; localized blurb present	RUN+GATE	de “für freie W present EN leak de/ru
C67-BLK2	localized product meta/OG/ JSON-LD desc	vasic / products/ {de,ru,ar}/ catalogizer	meta+og+JSON- LD desc present & non-EN	RUN+GATE	0 “self- hostabl leak de ar; all 3 desc slo localize
C67-HEAD	creative headings localized	vasic / products/de/ catalogizer	0 EN prod.head.* headings	RUN+GATE	0 of 5 E heading on de page; 5 German heading render
C67-LINUX	brand “Linux” stays Latin	vasic / products/ {hi,ko,ar,fa}/ qemu-utils	0 transliteration; Latin “Linux” present	RUN+GATE	0 लिनक्स 눅스/لینوکس; لینوکس; Latin “Linux” present 4
C67-PDF	sr cover- letter term correct	milos sr Cover Letter PDF	“Пропратно писмо” present;	RUN	present “Прија

ID	Fix	Surface	Gate	Class	Live/ga measu
			“Пријава” absent		

Overall verdict = PASS only if **all** Challenges PASS (§11.4.134 — loop to the responsible specialist on any FAIL; never relax the assertion).

C67-FOOTER — deterministic © year (§11.4.216 / §11.4.50)

Claim. The footer copyright year is GENERATED (pinned via `-ldflags -X main.buildYear` on `vasic; ephemeral_config.deploy.yml` on `milos Jekyll`), never a hardcoded literal. Identical source ⇒ byte-identical rebuild.

RUN assertion. Served / on each site matches © <4-digit> <Brand> with year ≥ 2026. **GATE assertion.** Build with `buildYear=2099`; **every** <footer>...© <year> reads © 2099. **Golden-BAD.** The pre-fix state: `15_content/sites/vasic-digital.home.*.json` carried a hardcoded `"footer": "© 2026 ..."`; in a 2099 build those rendered © 2026 → GATE detector 1 flags any footer year ≠ 2099.

```
{ "challenge": "C67-FOOTER", "site": "vasic.digital", "verdict":
  "PASS",
  "live_year": 2026, "sentinel_build_all_2099": true }
```

C67-BLK1 — localized portfolio card blurbs (§11.4.140/141)

Claim. Card blurbs on `/portfolio/<lang>/` come from the localized markdown, not the EN `portfolio.json`. **RUN.** `/portfolio/de/` contains “für die freie Welt”; `/portfolio/{de,ru}/` contain 0 of {self-hostable media collection, for the free world}. **Golden-BAD.** Pre-fix `portfolioCard` emitted `e.Tagline (EN)` for every lang → EN phrases present on localized pages.

C67-BLK2 — localized product descriptions (§11.4.140/141)

Claim. Product `meta[name=description]`, `og:description`, and JSON-LD `SoftwareApplication.description` are localized (sourced from the localized markdown). **RUN.** `/products/{de,ru,ar}/catalogizer.html`:

0 EN summary leak; all three description slots present and ≥ 20 chars. **Golden-BAD.** Pre-fix desc := firstNonEmpty(e.Summary, e.Tagline) (EN) + seo.go description = e.Summary $\rightarrow$ English meta on 462 localized pages/site.

C67-HEAD — creative section headings localized

Claim. The ~ 40 creative headings (prod.head.*) are data-driven i18n, translated to 15 langs. **RUN.** /products/de/catalogizer.html contains 0 of the EN heading set. **Golden-BAD.** Pre-fix headings were hardcoded Go string literals $\rightarrow$ English on every lang.

C67-LINUX — brand “Linux” stays Latin

Claim. “Linux” (brand) is never transliterated; glossary-protected for future translations. **RUN.** /products/{hi,ko,ar,fa}/qemu-utils.html: 0 transliteration, Latin “Linux” present. **Golden-BAD.** Pre-fix: 81 transliterations (लिनक्स/리눅스/لينكس/لينوكس) across 32 content files.

C67-PDF — sr cover-letter term

Claim. The Serbian cover-letter PDF uses “Пропратно писмо” (cover letter), not the mistranslation “Пријава” (job application). **RUN.** Milos_Vasic_Cover_Letter_SR.pdf pdftotext contains “Пропратно писмо”, 0 “Пријава”. **Golden-BAD.** Pre-fix sr.cover.eyebrow = “Пријава”.
