

README

OpenDesign Design System

The single source of visual truth for **both** sites, all documents, and all PDFs, per Helix Constitution §11.4.162 (OpenDesign is the mandatory design/token system — no ad-hoc CSS, no other token system). Generated with OpenDesign (github.com/nexu-io/open-design) via a verified, LLMsVerifier-approved model.

Structure

```
design-system/  
  brand-milosvasic/    milosvasic.css    DESIGN.md    # personal  
brand — crimson #a31e39  
  brand-vasic-digital/ vasic-digital.css DESIGN.md    # company  
brand — red #dc3545  
  icons/              icons.svg              # self-hosted  
SVG sprite (currentColor)  
  fonts/              fonts.css + <family>/*.woff2 # self-hosted  
brand typefaces (OFL 1.1, no CDN)  
  preview/            *.html + *.png        # component  
gallery + rendered proof (light+dark)  
  _prompts/           *.md                  # the  
OpenDesign generation prompts (reproducible)
```

Architecture — shared foundation + two brand themes

Both stylesheets share an identical **foundation**: typography scale (fluid clamp()), spacing (4px base, --od-space-1..12), radius, shadow, motion, z-index, container width, and the SAME component set (.od-*). They differ **only** in the accent color ramp (crimson vs red) and the dark-accent value. This satisfies “one system governs everything” while keeping the personal and company brands distinct.

- **Tokens:** CSS custom properties on :root (light) with a complete dark override in BOTH :root[data-theme="dark"] AND

@media (prefers-color-scheme: dark). Every component is styled *only* from tokens.

- **Components:** od-skip-link, od-btn (--primary/--secondary/--ghost + states), od-card, od-chip, od-field/od-label/od-input/od-textarea, od-header/od-nav, od-footer, od-hero, od-stat, od-section (+__eyebrow mono), od-product-card, od-product-detail (article typography), od-table, od-dialog (accessible modal), od-badge--status (--roadmap/--in-development/--beta), od-tag--license.
- **Accessibility:** WCAG 2.2 AA contrast (status-badge contrast verified/fixed per §11.4.107), :focus-visible rings, prefers-reduced-motion, logical properties for RTL.

Extended component library — components-extended.css

A single, 100% token-driven stylesheet layered **on top of** either brand CSS (it declares no :root — every value is var(--od-*), so it inherits each brand's tokens and is correct for **both brands** and **both themes** automatically). Generated THROUGH OpenDesign in 4 themed batches (prompts in _prompts/components/, concatenated; §11.4.162 — no ad-hoc CSS). Every interactive control ships a :focus-visible ring (--od-focus), hover/active/selected/disabled states, ARIA-friendly class hooks, WCAG 2.2 AA text contrast, and a prefers-reduced-motion guard per batch plus a global one.

Load order: <link> brand CSS → components-extended.css → motion/animations.css.

Catalog (all od- prefixed):

- **Overlays:** od-toast + od-toast-region (--success/--warning/--danger/--info, __icon/__body/__title/__msg/__close); od-menu/od-dropdown (__item[aria-disabled]/__separator/__label); od-select (__control[aria-expanded]/__chevron); od-tooltip (__bubble[data-placement]); od-popover (__arrow/__title/__body); od-fab (+--sm).
- **Forms:** od-switch (__input/__track/__thumb); od-checkbox (__box, checked + :indeterminate); od-radio (__dot); od-range (cross-browser input[type=range] thumb/track); od-segmented (__option[aria-selected]); od-search (__input/__icon/__clear); od-stepper (__btn/__input, no native spinners).
- **Nav + feedback:** od-tabs (__list/__tab[aria-selected]/__panel); od-breadcrumb (__list/__item[aria-current]/__link); od-pagination (__link[aria-current]/[aria-disabled]); od-progress (+--indeterminate, __bar); od-spinner (+--sm/--lg, od-visually-hidden label helper); od-skeleton (+--text/--circle); od-alert/od-banner (--success/--warning/--danger/--info, __icon/__title/__body); od-avatar (+--sm/--lg/--ring, od-avatar-group); od-empty-state (__icon/__title/__msg/__action).

- **Chrome:** tasteful custom scrollbar — global `html + opt-in .od-scroll` (Firefox `scrollbar-color/scrollbar-width` + WebKit `::-webkit-scrollbar*`), all token-colored.

Proof: `preview/components.html` instantiates every component; `_tests/visual/visual-oracle.js` at full-page height (1280x8000) returns **PASS** in light **and** dark (0 overlap/clip/giant). WCAG spot-checks (toast/alert title & body, dropdown item) all clear $\geq 4.5:1$ in both themes. Evidence: `_tests/evidence/components/{components.{light,dark}.png,components.verdict.json,wcag-contrast.txt}`.

How each surface consumes it

- **milosvasic.ru** (Jekyll): `@import/@use brand-milosvasic/milosvasic.css` into `assets/css/style.scss`; components use `.od-*` and `var(--od-*)` only.
- **vasic.digital** (static): `<link> brand-vasic-digital/vasic-digital.css`; markup uses `.od-*`.
- **Docs & PDFs:** the same tokens feed the pandoc→weasyprint pipeline (composed with the `constitution styles/default-pdf.css`), so CV / Cover Letter / Portfolio share the web design language.

Fonts — self-hosted (fonts/)

The three brand typefaces are **self-hosted** under `fonts/` — **zero CDN, zero external @import** (privacy / GDPR + §11.4.162 “no external font @import”). All three are **SIL Open Font License 1.1** (freely self-hostable); the full `OFL.txt` for each sits beside its `woff2` files.

- **Inter** (body, `--od-font-body`) — weights 400 / 500 / 600 / 700 — `fonts/inter/`
- **Space Grotesk** (display, `--od-font-display`) — weights 500 / 600 / 700 — `fonts/space-grotesk/`
- **JetBrains Mono** (mono, `--od-font-mono`) — weights 400 / 500 — `fonts/jetbrains-mono/`

The `woff2` are subset by script — **latin, latin-ext, cyrillic, cyrillic-ext** (the sites include Cyrillic languages) — and `fonts.css` sets unicode-range per subset so a page fetches only the scripts it uses. Each family is a **variable** `woff2` (one file per subset covers the whole weight axis); `fonts.css` emits a per-weight `@font-face` that pins font-weight to each instance, all with `font-display: swap` and `src: url('<family>/<file>.woff2') format('woff2')`, and font-family names matching the tokens exactly (Inter, Space Grotesk, JetBrains Mono).

Script coverage (honest): Space Grotesk is Latin-only — it has no Cyrillic, so Cyrillic *display* headings fall back to the body font (Inter, which does cover Cyrillic). **Arabic and CJK glyphs are NOT present** in any of these Latin/Cyrillic families — Arabic (ar) and CJK (zh/ja/ko) text falls back to the system stack in each brand's `--od-font-*` token. That is expected and acceptable for these brand faces.

How pages include it — add once, **before** the brand stylesheet, so the `@font-face` families are defined before the tokens reference them:

```
<link rel="stylesheet" href="/design-system/fonts/fonts.css">
<link rel="stylesheet" href="/design-system/brand-<brand>/
    <brand>.css">
```

For Jekyll (milosvasic.ru) the SCSS `@imports` the brand CSS; add the `fonts.css` `<link>` in the site `<head>` (or `@import "../fonts/fonts.css"`; from the brand SCSS entry). No `@import` reaches any external host — every `src` is a repo-relative `.woff2`.

Rendered proof + validation. `fonts/preview.html` links only `fonts.css` and renders pangrams and `display/body/mono` samples (Latin + Cyrillic) at every weight. Verified with headless Chromium (`_tests/node_modules`): the CSS Font Loading API reports all three families loaded, the browser fetched each self-hosted `woff2` over `file://`, and **zero external requests** were made. Evidence: `_tests/evidence/fonts/{fonts-preview.png, font-load-report.json, network-requests.txt}`. Each `woff2` is a valid Web Open Font Format (Version 2) file (`file(1)` / `w0F2` magic).

Reproducibility (§11.4.77)

Regenerate a brand stylesheet:

```
_tools/od/start-daemon.sh # headless
    OpenDesign daemon (Electron runtime)
bash _tools/od/generate.sh design-system/_prompts/<brand>.md
    design-system/brand-<brand>/<brand>.css other 24000
```

Rebuild + re-render the proof gallery:

```
node _tools/od/build-preview.mjs
NODE_PATH="$PWD/_tests/node_modules" node _tools/od/shoot.cjs
    '<jobs-json>'
```

BYOK: `source ~/api_keys.sh`; `provider = openai-compatible`, base `https://api.mistral.ai/v1`, model `codestral-latest` (LLMsVerifier-verified, code:true, score 0.919). Keys are sourced at runtime, never stored.

Evidence

preview/{milosvasic,vasic-digital}-{light,dark}.png — full-page renders of the component gallery in both themes for both brands (\$11.4.170 spirit). Regenerate anytime with the commands above.
