

OPERATOR-DECISIONS-2026-09-07

Operator decisions — 2026-09-07

Sixteen blocked items were put to the operator interactively and answered. This file is the record: what was blocked, what was decided, and what the decision obliges. Recorded per §11.4.208 so a decision is not re-litigated and not misremembered.

Status vocabulary: DECIDED (answered, not yet executed) · IN FLIGHT · DONE (executed with captured evidence).

The decisions

#	Blocked item	Decision	Status
1	submodules/ curriculum-kit is not a git repository; go.mod reaches outside the repo and no truthful manifest entry can be written	Publish as vasic- digital/ curriculum-kit, PUBLIC , mount as a gitlink, declare in helix- deps.yaml	DECIDED
2	3 area documents fail publication review on 62/54/58 uncited claim blocks	Operator reads them. Produce a bounded per- document list of exactly which claim blocks lack citations first	DECIDED
3	Only 5 of 42 areas carry a test	Author senior banks for the 25 strongly +	DECIDED

#	Blocked item	Decision	Status
		moderately evidenced areas, against real transcript evidence, area by area. The 12 thin areas stay honestly without tests	
4	FR-002 asked for a topical classification the reviews decline to make	Build an automated topical classifier, recorded with its confidence and given its own review	DECIDED
5	Four authored schema values (70% pass, mcq 2 / short 3, the 91–95 prefix shift, anchor attachment)	Accept all four as-is	DONE
6	SC-010 hue floor: gate reported 4 families over a defective instrument	Fix the gate, then judge the real number. Fixed; the corrected gate reports 2	DONE (fix) / OPEN (the design finding)
7	Two chapter-card implementations;/ chapters never uses the component extracted for it	Converge onto the shared component	DECIDED
8	The 37-area lexicon is chapter-01-derived; chapters 02 and 02.01	Mine both, propose new areas, operator approves additions before they publish	DECIDED

#	Blocked item	Decision	Status
	were never mined		
9	12 documents' ingested .sections. are stale; regenerating mints new passage ids	Leave stale, record it explicitly. All 251 ids resolve; regenerating would churn the corpus and break existing citations	DECIDED
10	tesseract absent (gate 5 → rc 2); bundle/bundler/ jekyll absent (gate 6 asserts against an 8-file fragment)	Provide both — CONTAINERISED, through submodules/containers, not host packages. Operator directive: <i>"Make sure everything runs in containers, use our containers Submodule for all containers related work!"</i>	DECIDED
11	Content-boundary gate red at ~15,300 matches; decision packet never acted on	Judge the ~1,540 class-A inward rows — 1,084 against private source, 68 against teaching material, three public files holding 1,120	DECIDED
12	deploy-langs.sh downgrades a failed Jekyll build to a warning and still exits 0	Fail the deploy on a failed build, behind a flag for deliberate override	DECIDED
13	milosvasic.ru/_site/ tracked: 8 files, 1 page, answers 1 of 525 sitemap URLs	Untrack it, keep the ignore rule	DECIDED

#	Blocked item	Decision	Status
14	21 repositories have Actions enabled while declaring zero workflow files	Sweep the 20, exclude milosvas ic.ru — its <code>pages.yml</code> is the sole publish path for the live site	DECIDED
15	design-toolkit GitLab mirror 7 commits behind, recipe deliberately <code>.disabled</code>	Enable the recipe and sync the mirror	DECIDED
16	Nothing committed this session; container serves the old binary	Restart once when all writers stop, then commit and push recursively	PENDING

Decisions that reversed a recommendation

Recorded because a recommendation overruled is worth more than one accepted.

- **#4 topicality** — I recommended a human checkpoint on the grounds that 42 areas is an afternoon's reading and a classifier inherits the jargon-free-title blind spot. **Operator chose the classifier.** Obligation: it must read the area **body**, not the title, or it reproduces exactly the blind spot that made the term-in-name probe understate its own result.
- **#10 host toolchains** — I offered host package installs. **Operator required containers**, invoking `submodules/containers` per §11.4.76. Obligation: no `apt-get` on the host; both workloads reached through that module, and the module's own runtime detection rather than a frozen podman literal.
- **#15 GitLab mirror** — I recommended leaving it disabled because enabling it starts publishing to a private mirror on every push. **Operator chose to enable and sync.** Obligation: the mirror is PRIVATE and the source is PUBLIC, so this is a public→private flow, which carries no disclosure risk in that direction. Verified before acting.

What #6 now obliges — the finding is real and it got worse

The gate had three confirmed defects and all three are fixed, verified by me before the fix and by an independent prover after:

Defect	Was	Now
Non-text rows graded the ground <i>behind</i> an indicator, so a coloured chip could never contribute a family	bg only	sampler emits paint (own background, else own border); palette families over bg u paint; contrast gate untouched
One-ULP bucketing split one ramp in two (29.999999999999998 vs 30.0)	2 families	1
HSL saturation called a 3-unit RGB spread chromatic at one end of a ramp and neutral at the other	ramp split 3 ways	OKLab chroma, floor 0.01 — the whole ramp is neutral

The corrected gate reports 2 families against a floor of 6 — down from the broken gate’s 4. Three of those four were one warm surface ramp counted three times. Nothing was widened, lowered or padded to reach that number.

Two boundaries the fix did not close, both stated rather than absorbed:

1. **The non-text fix contributed nothing to the live count**, because the sampler matched **zero** non-text rows on the sampled route — no input, hr, .badge, .chip, .tag or [role=status]. The chip, rule and rail hues measured elsewhere are still outside the sampler’s population. Widening the selector list is a separate decision and was **not** taken, because doing it while chasing a count is how an instrument gets tuned to a result.
2. The design finding is now unambiguous: **the served interface paints two hue families across its principal surfaces**. The theming agent’s counter-measurement found the taxonomy families painting on rules, chips, washes and the rail ground — real, and reaching only elements the population excludes. Both

facts are true: the palette exists, and it is not on the principal surfaces.
