

QWEN.insert-block

INHERITED FROM constitution/QWEN.md

The inheritance below is conditional. Both cases are stated; neither is assumed.

When this module is consumed inside a project that includes the Helix Constitution submodule, the rules in `constitution/QWEN.md` — and in the `constitution/Constitution.md` it references — are authoritative for every topic not covered here. The module-local rules below extend them; they never weaken or override them.

When this module is consumed standalone — cloned on its own, with no constitution reachable in any parent — there is nothing to inherit, and **only the module-local rules below apply**.

Locating the base file: a resolver, never a path

`constitution/QWEN.md` in the heading above is the **canonical name of the base file**, written exactly as the constitution's own examples write it. It is not a filesystem path relative to this module, and it must not be rewritten into one:

- a consuming project may mount the constitution under more than one layout, and this module cannot know which one it got;
- the same commit of this module can be checked out at two different depths at the same time, so no single relative path is correct for both;
- a standalone clone has no constitution anywhere, so any hardcoded path would simply dangle.

Resolve it at run time with the constitution's own parent-walk resolver, **`find_constitution.sh`**. It walks up the parent chain trying each layout the constitution supports, follows `git rev-parse --show-superproject-`

working-tree out of nested submodules so it works from any nested depth, and exits non-zero with an explicit error when no constitution is reachable — which is precisely the standalone case above.

This file therefore hardcodes **no** parent-project path and **no** depth-dependent path, keeping the module project-not-aware, decoupled and reusable per §11.4.28(B). Agent tooling with a native file-import syntax must not turn the heading into one: an @constitution/QWEN.md import resolves relative to *this* file, so inside a module it points at a path that does not exist and silently resolves to nothing.
