

DOC-AUDIT

Documentation Audit — docs/ setup-agents-wizard/

Read-only correctness audit of the seven-document set against the three scripts it documents. Nothing outside this file was created, edited or executed against the real environment.

Scope and method

Artifact	State audited (sha256)
scripts/setup-agents-wizard.sh	7f2fc18b6c0b0ed32465ae9efd992130b544b6846e19ff2c5f31676478276

The three scripts changed twice while this audit was in progress (two rounds of edits by another process). All findings below are stated against the hashes in the table above, which were stable for the final 3+ minutes of the audit. The seven documents did **not** change at any point. If the scripts move again, re-verify the rows marked (*new behaviour*).

Checks performed: extraction and verification of every command, flag, path, package and environment variable named in the docs; a full static inventory of the test suite; a github-sluggger-equivalent resolution of all 86 relative links and in-page anchors; an mmdc 11.12.0 render of all six Mermaid blocks; and live probing of the installed lumen 0.0.41 CLI to check the flag tables.

Verdict

67 findings: 17 Critical, 41 Major, 9 Minor.

Three whole subsystems that the wizard performs today are **absent from all seven documents**: the Step 7 project-indexing pass (WIZARD_INDEX_PROJECT), the glyphdown-hook opt-out (WIZARD_SKIP_GLYPHDOWN_HOOK), and the telemetry opt-out (configure_telemetry_optout, WIZARD_KEEP_TELEMETRY) which writes a third managed block into ~/.bashrc, runs codegraph telemetry off and edits ~/.qwen/settings.json. Grep across all seven files returns zero hits for WIZARD_SKIP_GLYPHDOWN_HOOK, WIZARD_INDEX_PROJECT, WIZARD_KEEP_TELEMETRY, telemetry, DO_NOT_TRACK, usageStatisticsEnabled and Step 7.

ARCHITECTURE.md is the worst-affected document: its statement at line 11 that “Every diagram below is derived from the current code” is false — two of its six diagrams depict the exact behaviour the wizard removed and the test suite now forbids.

SAFETY-AND-ROLLBACK.md and MANUAL.md are otherwise the most accurate documents, but both now carry stale rollback semantics (MODIFIED vs CREATED, and the SpecKit undo action) that the most recent script edit inverted.

TROUBLESHOOTING.md is very nearly clean — one Minor finding only.

Also verified clean, with no findings at all:

- **Cross-links:** all 86 relative markdown links and in-page anchors resolve. Zero broken.
- **Mermaid:** all six mermaid blocks in ARCHITECTURE.md render successfully under mermaid 11.12.0 (blocks at lines 31–131, 151–189, 209–235, 254–300, 330–348, 368–390). No parse errors. Their *content* is wrong in places (see findings); their *syntax* is fine.
- **Stale @qoomon/lumen / "args": ["serve"] presented as current:** none. Every occurrence is either codegraph's legitimate serve, or is explicitly framed as a documented past bug.
- **Embedded script listing in README.md:** correctly removed; README.md:378 and MANUAL.md:8-9 describe its removal rather than reproducing it.

Findings

Critical

File	Line	Incorrect claim (quoted)	What the code actually does
ARCHITECTURE.md	11	“Every diagram below is derived from the current code.”	Diagram 1 (§1) and diagram 4 (§4) describe the pre-install wizard: bare-name repository, agent installs, scoped dependencies, retries, five wrong Mermaid config paths and a TypeScript hook. None of that exists in scripts/setup-agent-wizard.sh.
ARCHITECTURE.md	51	AGT["npm i -g kimi, opencode, mimo, qwen-code"] --> AGTQ{"install failed?"}	The wizard never npm installs these. Lines 6-10 are a detection-only sequence for printing the vendor's name. Only qwen is installed via @qwen-code/qwen-code.

File	Line	Incorrect claim (quoted)	What the code actually does
ARCHITECTURE.md	52	AGTQ -- yes --> AGTF["retry scoped names kimi/cli, opencode/cli, mimo/cli, qwen-code/cli"]	653). Test A13 asserts that <code>install -g (kimi\ opencode\ mimo\ qwen-code) apply</code> is run zero times. No scoped-name retry. Test A12 asserts @kimi, @opencode/cli and @qwen never appear on an executable line.
ARCHITECTURE.md	92–96	M1["Step 5 - configure MCP servers"] --> MC["~/.claude/mcp.json"] ... MK["~/.kimi/config.json"] ... M0["~/.opencode/config.json"] ... MM["~/.mimo/config.json"] ... MQ["~/.qwen-code/config.json"]	All five are the orphan paths the wizard stopped writing. Real targets: claude.json ... -s user (line 799), ~/.kimi-code/mcp.json, ~/.config/opencode/opencode.json (801), settings.json (830); Code gets no file (821).
ARCHITECTURE.md	98	MPL --> MHK["jq: add glyphdown ToolCall hook to ~/.claude/settings.json"]	The wizard writes <code>~/.hooks.PreToolUse</code> and <code>~/.hooks.PostToolUse</code> (777–785). Test A21 asserts literal "ToolCall" is a jq-merge. The step is also skipped if <code>glyphdown</code> is missing or <code>WIZARD_SKIP_GLYPHDOWN</code> is set.
ARCHITECTURE.md	272–277	M1["~/.claude/mcp.json"] ... M3["~/.kimi/config.json"] ... M4["~/.opencode/config.json"] ... M5["~/.mimo/config.json"] ... M6["~/.qwen-code/config.json"]	Same orphan paths as above, repeated in the “File touched” diagram. <code>~/.config.json</code> in particular is shown as a jq-merge for an agent the wizard writes nothing for.
ARCHITECTURE.md	273	M2["~/.claude/settings.json glyphdown ToolCall hook"]	PreToolUse / PostToolUse ToolCall.
ARCHITECTURE.md	303	“All five agents receive the identical MCP block — lumen pointed at the absolute wrapper	Only Kimi and Qwen receive that block (<code>configure_mcp_for_agents</code>).

File	Line	Incorrect claim (quoted)	What the code actually does
		path with args ["stdio"], plus codegraph with args ["serve"]."	lines 141–175). Claude gets lumen only, via the Opencode gets lumen the .mcp schema as {"type":"local", "co [...,"stdio"],"enable — MANUAL.md:266 cor says “CodeGraph is n here”. MiMo Code ge nothing.
ARCHITECTURE.md	315	“scripts/test-setup-agents-wizard.sh runs six groups.”	Eight groups: A–H. gr Telemetry opt-out (\ \$HOME) " is declared line 392 and group " 446. README.md:269 s “seven groups” — th documents contradic other, and both are n wrong.
MANUAL.md	128	“Note the {} is written <i>before</i> backup_file, so a config the wizard creates from scratch is recorded MODIFIED with {} as its original.”	(new behaviour) Rev configure_mcp_for_a calls snapshot_before "\$component" "\$conf at line 149, before th at 150–152, with the “Snapshot BEFORE s the file.” Test G16 ass row is CREATED, and G asserts rollback dele file.
MANUAL.md	261	“The {} is written <i>before</i> backup_file, so on a clean machine the manifest records MODIFIED with {} as the original.”	(new behaviour) snapshot_before cla "\$CLAUDE_SETTINGS" n line 773, before the { 774.
SAFETY-AND-ROLLBACK.md	582–587	“A config the wizard had to create from scratch is recorded as MODIFIED, not CREATED. configure_mcp_for_agent and the Glyphdown hook step write {} into a missing file <i>before</i> calling backup_file, so the stored original	(new behaviour) No l true for either code p (script lines 149 and Tests G16/G17 are the regression guards. T sits under “What is n

File	Line	Incorrect claim (quoted)	What the code actually does
		is {} and rollback restores an empty {} file instead of deleting it.”	reversible”, so it undoes what rollback now does. <i>(new behaviour)</i> The branch now records record_action speckit tool uninstall spec (script line 639). Test asserts it. A user who run-actions believing is out of scope will not specify-cli uninstall
SAFETY-AND-ROLLBACK.md	98	\ uv tool install specify-cli\ Only npm_install_if_missing records an undo ACTION; the uv branch does not \	
SAFETY-AND-ROLLBACK.md	580–581	“uv tool install specify-cli records no ACTION. Only npm_install_if_missing writes undo rows. Uninstall SpecKit by hand if you want it gone.”	<i>(new behaviour)</i> As a record_action speckit script line 639.
FAQ.md	545–547	“## Does the wizard index my project?” / “No. It sets up the launcher, PATH, completions, the embedding backend and the MCP configs, then prints the commands for you to run:”	With WIZARD_INDEX_PROJECT set, Step 7 (script lines 881–909) runs codegraph sync/codegraph init lumen index "\$PROJECT". The answer is only c the default, opt-out p
(all 7 docs)	—	WIZARD_SKIP_GLYPHDOWN_HOOK appears zero times across the entire doc set.	Script lines 765–769: skips the glyphdown registration entirely final summary print Glyphdown Hook skip request (WIZARD_SKIP_GLYPHDOWN_HOOK (line 995). Test A19 re the opt-out to exist. The wizard’s own comment it “documented”.
(all 7 docs)	—	WIZARD_INDEX_PROJECT and Step 7 appear zero times across the entire doc set.	Script lines 881–909 7: Indexing This Project opt-in via WIZARD_INDEX_PROJECT A25–A27 cover it; A10 asserts step headers "1,2,3,4,5,6,7,".

File	Line	Incorrect claim (quoted)	What the code actually does
(all 7 docs)	—	telemetry, WIZARD_KEEP_TELEMETRY, DO_NOT_TRACK, usageStatisticsEnabled and configure_telemetry_optout each appear zero times across the entire doc set.	(new behaviour) configure_telemetry (script lines 384–430) unconditionally as the act of ensure_lumen (It appends a third m block to ~/.bashrc (# telemetry opt-out (by Claude Code) >>> DO_NOT_TRACK=1 and CODEGRAPH_TELEMETRY codegraph telemetry .usageStatisticsEna false in ~/.qwen/ settings.json, and a “Telemetry / analytics section to the final su (lines 975–991). Tests and group H (H1–H7)

Minor

File	Line	Incorrect claim (quoted)	What the code actually does
ARCHITECTURE.md	249	“Every pre-existing file is copied to <file>.bak.<YYYYMMDDHHMMSS> before modification”	~/.local/share/bash-completion/completions, lumen is registered with snapshot_before only (script line 303) and gets .bak sibling — as SAFETY AND-ROLLBACK.md:85-87 and TROUBLESHOOTING.md:708 both state. Internal contradiction.
ARCHITECTURE.md	247–309	“## 4. Files touched”	The rollback state directory ~/.local/share/setup-agents-wizard/backups/<utc>/ is created on every run (script lines 64–67) but appears in no subgraph.
MANUAL.md	172	“mkdir -p ~/.local/bin; backup_file \"\$LUMEN_WRAPPER\"; writes the wrapper from a quoted heredoc; chmod 755.”	The real call passes the component: backup_file \"\$LUMEN_WRAPPER\" lumen (script line 212). Without the default would be missing which the same document says is unused.
MANUAL.md	517–529	The lumen [command] “Available Commands” block, under “Confirmed against lumen 0.0.41”	Verified live: the real lumen --help also lists help about any command. Everything else in the block matches exactly.
MANUAL.md	500–508	The in_sandbox() { ... } code block	Not byte-exact: the real helper (test lines 59–72) also contains set -uo pipefail, a four-line comment, and set +e before \$1.
README.md	243	“- /reload-plugins” (under “ Claude Code : Restart the IDE extension. Inside Claude, type:”)	The wizard’s printed next steps list names only /code mode and /fixclaude (script line 947). /reload-plugins

File	Line	Incorrect claim (quoted)	What the code actually does
TROUBLESHOOTING.md	550	“Unit groups A–E run against a throwaway \$HOME and throwaway git repositories.”	is not printed by the wizard and is not verifiable from any script in this repository. Group A reads the wizard source only — no sandbox (ARCHITECTURE.md:322 gets this right: “reads the wizard source only”). Groups G and H also run a throwaway \$HOME and not mentioned.
README.md	11	“...and, where the agent’s schema takes a server map, CodeGraph too”	Opencode’s .mcp is a server map, but the wizard adds only lumen there (script lines 806–809); MANUAL.md:266 says so explicitly.
README.md	407	“- Never overwrites your existing project files outside of submodules/.”	Still true for <i>overwrites</i> , Step 7 now creates .codegraph/ in the project root in addition to .specify//specs/. Worth naming so the claim stays unambiguous.

Verified correct

The following claims were checked against the code (or the live CLI) and are **accurate**. This list exists so the audit demonstrates coverage rather than only complaints.

The specific items flagged for verification

- **WIZARD_STATE_DIR is resolved at call time.** MANUAL.md:113, MANUAL.md:197, MANUAL.md:433 and SAFETY-AND-ROLLBACK.md:58-65 all correctly describe the re-resolution inside backup_init (script lines 60–62). README.md:212 correctly says it overrides the location. The

rollback tool reads the same variable (rollback-agents-wizard.sh:31).

- **SETUP_WIZARD_LIB_ONLY library mode.** MANUAL.md:472-486 quotes the guard verbatim and correctly notes that SCRIPT_DIR/PROJECT_ROOT are computed *before* it (script lines 545–553). MANUAL.md:86-89 and MANUAL.md:137-138 correctly state that npm_install_if_missing is defined *below* the guard and is unavailable in library mode.
- **Every rollback flag exists and behaves as documented.** --list, --session, --component/-c (repeatable, all accepted), --dry-run/-n, --yes/-y, --run-actions, --help/-h — all present at rollback-agents-wizard.sh:38-49. The option table at SAFETY-AND-ROLLBACK.md:195-203 and the synopsis at MANUAL.md:30-31 are correct, including “Any other argument prints Unknown option: ... and exits 2”.
- **Rollback exit codes.** SAFETY-AND-ROLLBACK.md:209-216, MANUAL.md:76-80 and README.md:226 all match the script: 0 for success/--list/--help/--dry-run/nothing to do/declining the prompt; 1 for failures, missing backup root or missing manifest; 2 for a bad option; a failed ACTION warns without changing the exit code.
- **npm package names.** @colbymchenry/codegraph (script line 629) and glyphdown (line 630) are documented correctly everywhere, as is @qwen-code/qwen-code as the *package*. specify via uv tool install specify-cli (line 637) is documented correctly in README.md:94, USER_GUIDE.md:84, MANUAL.md:326 and FAQ.md:361.
- **The qwen binary name is correct in the wizard itself —** README.md:338, FAQ.md:360, SAFETY-AND-ROLLBACK.md:539 and MANUAL.md:302 all give the right *uninstall* command (npm uninstall -g ... @qwen-code/qwen-code). Only the *binary/probe* name is wrong, in the five places listed above.
- **Agent MCP config paths.** README.md:126-132, USER_GUIDE.md:178-184, MANUAL.md:260-268, FAQ.md:406-411, TROUBLESHOOTING.md:129-144 and SAFETY-AND-ROLLBACK.md:171-178 all give the verified real targets: claude mcp add-json lumen ... -s user; ~/.kimimcp/mcp.json (.mcpServers); ~/.config/opencv/opencv.json (.mcp, {"type":"local","command": [...], "enabled":true}); ~/.qwen/settings.json (.mcpServers); MiMo Code manual, no file. Each of the five documents also correctly labels the old orphan paths as leftovers from a previous revision.
- **stdio vs serve.** Every occurrence of "args": ["serve"] in the docs is either codegraph’s legitimate one (README.md:145, MANUAL.md:157, FAQ.md:486, ARCHITECTURE.md:304) or is explicitly presented as the past bug (README.md:387, TROUBLESHOOTING.md:126, FAQ.md:511).

TROUBLESHOOTING.md:166 — “codegraph legitimately uses serve. Only the lumen entry changes.” — is exactly right.

- **No stale @qoomon/lumen presented as current.** All five occurrences (README.md:273/378/386/395, MANUAL.md:324, FAQ.md:98/116, ARCHITECTURE.md:322) frame it as a removed 404, matching test A2.
- **The deleted README script listing.** README.md:368-378 correctly points at scripts/setup-agents-wizard.sh as the single source of truth and explains the removal; no document reproduces or links to an embedded listing.

Structural and mechanical checks

- **Cross-links: 86/86 resolve.** Every relative markdown link between the seven documents points at a file that exists, and every #anchor matches a real heading under GitHub’s slug rules — including the emoji-prefixed leading-hyphen anchors (#-safety-and-reversibility, #-what-changed-and-why, #-mcp-configuration-for-every-agent, #-script-source) and the underscore-bearing #library-mode-setup_wizard_lib_only, #why-does-the-wizard-not-set-lumen_embed_model.
- **Mermaid: 6/6 blocks parse and render.** mmdc 11.12.0 produced a valid SVG for every fenced block in ARCHITECTURE.md (127 KB, 42 KB, 30 KB, 35 KB, 27 KB, 30 KB respectively); no error SVGs, no parse failures. The flowchart TD, sequenceDiagram, flowchart LR and stateDiagram-v2 blocks are all syntactically sound, classDef/class statements included.
- **Test-count claims.** README.md:279’s “(15 assertions, G1–G15)” was the only numeric test-count claim in the entire doc set at the time it was written; it is now stale (see Major findings). No document states an overall assertion total, so no overall total is wrong — but none is right either. The true inventory is below.

Test-suite inventory (measured, sha256 5c33717...)

Counted by expanding every loop in scripts/test-setup-agents-wizard.sh (each call to assert_eq / assert_contains / assert_absent / record / skip increments TID).

Group	Test IDs	Distinct IDs	Records emitted
A — Static analysis of the wizard	A1–A32	32	36 (A12 fires 5×, once per bogus package)

Group	Test IDs	Distinct IDs	Records emitted
B — Lumen launcher unit tests	B1–B8	8	8
C — Shell configuration unit tests	C1–C10	10	10
D — MCP configuration unit tests	D1–D5	5	5 (or 5 skips without jq)
E — SuperSpec submodule safety	E1–E3	3	3
F — Live integration	F1–F8 + F5b	9	11 live (F2 fires 3×, once per shell kind) / 7 with --no-live
H — Telemetry opt-out	H1–H7	7	7 (H6,H7 skip without jq)
G — Backup manifest and rollback	G1–G18	18	18 (G16–G18 skip without jq)
Total	A–H, 8 groups	92	98 full live run / 94 with --no-live

Note the file declares group H (line 392) *before* group G (line 446), so the console output order is A, B, C, D, E, F, H, G.

Observations about the code (not documentation defects)

These are not doc errors, but they affect what the docs *could* truthfully say:

1. **--no-live skips F1–F7 but not F8.** Test line 293 is

```
for t in F1 F2 F3 F4 F5 F6 F7; do skip "$t live check" "--no-live"; done
```

— F8 is simply never recorded in that mode. The docs' claim that “--no-live skips group F” (README.md:281, ARCHITECTURE.md:407) is true in effect, but the evidence file will silently be missing an F8 row rather than showing it as skipped.

2. **configure_telemetry_optout** calls **backup_file "\$bashrc"** shell a **second time** (script line 391, after **configure_lumen_shell**'s call at 322). **snapshot_before** de-duplicates the manifest row correctly, but a *second* `~/ .bashrc.bak.<ts>` sibling is written on every run. Documents that describe `.bak` accumulation (`USER_GUIDE.md:423-426`, `SAFETY-AND-ROLLBACK.md:73-83`) will undercount by one per run.
3. **~/ .local/share/lumen** is confirmed as the index store — `lumen purge --help` states “Deletes lumen index databases under `~/ .local/share/lumen/`”, and the directory exists on this host. `ARCHITECTURE.md:281/304/364`, `MANUAL.md:270` and `FAQ.md:229-244` are correct.
4. **Every Lumen CLI flag documented in `MANUAL.md:534-606` was verified live against lumen 0.0.41:** `index (-b/--backend, -f/--force, -m/--model)`, `search (-b, --cwd, -f, --max-lines, --min-score, -m, -n/--n-results, -p/--path, --summary, --trace)`, `purge`, `stdio`, `completion (bash/fish/powershell/zsh)` and `hook (pre-tool-use, session-start)`. All match exactly.
