

LUMEN-STORE-INVENTORY

Lumen Index Store — Read-Only Inventory

Host: this machine (nezha)
Store: ~/.local/share/lumen/
Generated: 2026-08-27 20:34
Mode: READ-ONLY. No index was deleted, no DB was opened read-write, lumen purge was never invoked, lumen index was never invoked.

0. STOP — four indexers are writing RIGHT NOW

The brief warned about one active rebuild. There are in fact **four concurrent lumen index processes** holding open write handles on the store. All four index directories must be excluded from any purge.

Index dir	PID	Project being indexed	Size	Note
74e360aac96f417e	1693992	<ext-volume-host>/Projects/boba	681.9 MB	index
21bf1507a8925bcf	840272	<ext-volume-host>/Projects/vasic	347.9 MB	index -f (THE named active rebuild)
feaae19c7a38712e	1692994	<ext-volume-host>/	270.4 MB	index

Index dir	PID	Project being indexed	Size	Note
		Projects/ lava		
06dd1f85fde5febb	1789297	<ext-volume-host>/ Projects/ boba/ constitution	15.1 MB	index (no project_path written yet)

- **21bf1507a8925bcf is the index for <ext-volume-host>/Projects/vasic** — the rebuild the operator flagged. It is 347.9 MB with an 82 MB write-ahead log open by PID 840272. **It must never be purged.**
- **06dd1f85fde5febb is a trap.** A naive inventory classifies it as an orphan, because it has *no* project_path in project_meta. It is not an orphan — it is a *brand-new index in flight* for <ext-volume-host>/Projects/boba/constitution (PID 1789297). Lumen writes project_path only when indexing **completes**, so an in-progress index is indistinguishable from a crashed one by DB contents alone. It is the 7th-largest directory in the store. Verified by reading /proc/1789297/fd.

Practical consequence: **do not purge anything while these four processes are alive.** Re-check with `ps -ef | grep 'lumen.*index'` immediately before acting, and re-derive the in-flight set — a different set of indexers may be running by then.

1. Totals

Metric	Value
Entries under ~/.local/share/lumen/	765 — 764 index directories + debug.log
Index directories	764
Total size on disk	2.55 GB (2608.4 MB, 2735061888 bytes)
Distinct project_path values recorded	537
Duplicate project_path (2+ dirs, same project)	0

Metric	Value
Embedding models in use	1 — ordis/jina-embeddings-v2-base-code
vec_dimensions values in use	1 — 768
Non-index file	debug.log, 6.9 MB, appended to by all 4 running indexers

Breakdown by classification

Class	Count	Size	% of store	Meaning
ACTIVE-REBUILD	2	362.9 MB	13.9%	Being written right now — never purge
LIVE	10	1288.7 MB	49.4%	project_path exists, current model, not in flight
DEAD	525	934.7 MB	35.8%	project_path no longer exists on disk
WRONG-MODEL	0	0.0 MB	0.0%	project_path exists but model differs from default
INCOMPLETE	227	22.1 MB	0.8%	DB opens, but no project_path/embedding_model recorded
TOTAL	764	2608.4 MB	100%	

There are zero WRONG-MODEL indexes. Every index that records an embedding_model records ordis/jina-embeddings-v2-base-code, and every index records vec_dimensions = 768. The “past embedding-model switch” hypothesis in the brief is **not supported by the data** — there is no evidence of a model switch in this store.

2. Reclaimable space, split by confidence

Tier	Class	Count	Size	Confidence
1	DEAD — ephemeral / tmp scratch dirs	524	934.6 MB	Definitely deleted
2	DEAD — real project path	1	0.1 MB	Definitely deleted
3	INCOMPLETE — aborted index runs	227	22.1 MB	Safe, but not purgeable by path
	Total reclaimable	752	956.8 MB (0.93 GB)	
	<i>Possibly unmounted (do not touch)</i>	0	0.0 MB	n/a — see §4
	WRONG-MODEL	0	0.0 MB	none exist

Reclaiming everything in tiers 1-3 takes the store from **2.55 GB to 1.61 GB** (a 37% reduction), leaving the 10 LIVE indexes untouched — including the two (boba, lava) that are themselves being written right now, and both ACTIVE-REBUILD entries. All four in-flight index directories from §0 are excluded from every command in §7.

Perspective on the payoff. 752 of the 764 directories (98%) are garbage, but they are only 957 MB of a 2.55 GB store. The store is big because of **five real projects**, not because of orphans. boba alone (681.9 MB) is larger than every DEAD and INCOMPLETE index combined. If the goal is disk space rather than tidiness, the orphans are the smaller half of the problem.

3. The 20 largest indexes

#	Index dir	Class	Size	Files	Chunks	DB mtime	Project
1	74e360aac96f417e		681.9 MB	14825	201252	2026-08-27 20:02	

#	Index dir	Class	Size	Files	Chunks	DB mtime	Project

Redaction — 2026-09-02. The 6ea66d6d87cbf1e9 row above (rank 8) ends in assignments/.... The ... is a deliberate elision, not a truncated path: that project path's final component was a third party's given name, and this repository is public. Recorded as a separate instance in [docs/content-boundary-incident-2026-09-01.md](#) §13.

Everything below rank 20 is a 3.1 MB DEAD scratch index or a 0.1 MB INCOMPLETE stub — the tail is flat and uninteresting. The whole store is: 5 real projects, 1 in-flight newcomer, and ~740 pieces of lint.

4. Unmounted-drive risk — assessed and cleared

The brief correctly flags the danger: this host mounts projects under /run/media/..., so an unmounted external drive would make a LIVE project look DEAD. **That risk was checked explicitly and it does not materialise here.**

Evidence:

- 1. **No DEAD index records a path under /run/media/ at all.** Of 525 DEAD indexes, 524 point into /tmp and 1 points at <linux-host>/Projects. Zero point at removable media.
- 2. The only volume ever mounted under this host’s removable-media root is the one this document calls <ext-volume-host>, and it **is mounted right now** (/dev/nvme0n1p1 → <ext-volume-host>, btrfs, 3.6 TB). Every /run/media/... path in the store resolves successfully.
- 3. /home is a separate mounted filesystem (/dev/nvme1n1p3) and is mounted. /tmp is mounted.
- 4. lsblk shows no other block device with an unmounted filesystem holding projects.

Path prefix of DEAD indexes	Count	Size	Filesystem mounted?	Verdict
/tmp/.private/milosvasic/tmp.*	511	933.4 MB	yes (/tmp)	Definitely deleted — per-session agent scratch dirs
/tmp/* (other)	13	1.2 MB	yes (/tmp)	Definitely deleted — test fixtures
<linux-host>/Projects	1	0.1 MB	yes (/home)	Definitely deleted — parent dir absent
/run/media/**	0	0.0 MB	—	none exist

Conclusion: “possibly unmounted” = 0 indexes / 0.0 MB. All 525 DEAD indexes are definitely deleted.

The /tmp finding also explains the store’s shape: 511 of 525 DEAD indexes are one-file, one-chunk indexes of mktemp-style agent scratch directories that were indexed once and vanished at reboot. Each costs ~3.1 MB (a near-empty SQLite + vector-table skeleton), which is why 511 trivial indexes add up to 933.4 MB.

5. LIVE indexes (keep)

Index dir	Size	Files	Chunks	Last indexed	Project path
74e360aac96f417e	681.9 MB	14825	201252	2026-08-25T23:41:53Z	<ext-volume-host>/Projects/boba
feaae19c7a38712e	270.4 MB	7920	77163	2026-08-26T13:28:54Z	<ext-volume-host>/Projects/lava
e7758398337f6aa7	139.5 MB	282	2038	2026-07-26T22:24:38Z	/tmp/.private/milosvasic
0e540668e98c02ce	125.2 MB	2247	37348	2026-07-26T19:21:56Z	<ext-volume-host>/Projects/claude_toolkit
40b9531ba54c9f4f	45.7 MB	1000	13255	2026-08-13T09:55:35Z	<ext-volume-host>/Projects/tmux

8addff8070269398	6.5 MB	220	1051	2026-08-20T15:38:47Z	<ext-volume-host>/Projects/lava/.claude/worktrees/agent-ae3b1805128e2e0c8
35d7137ceae5a7b4	3.2 MB	51	351	2026-07-22T17:59:52Z	<ext-volume-host>/Projects/helix_seller
d0d7a5956ee798fd	3.2 MB	66	512	2026-07-31T15:45:07Z	<home>/Downloads

Index dir	Size	Files	Chunks	Last indexed	Project path
97e1836a7eabe96a	0.1 MB	0	0	2026-07-12T16:41:04Z	<home>/Downloads/ flashing/1.2.1-dev-0.0.3

Redaction — 2026-09-02. The 6ea66d6d87cbf1e9 row above ends in assignments/.... The ... is a deliberate elision, not a truncated path: that project path’s final component was a third party’s given name, and this repository is public. Recorded as a separate instance in docs/content-boundary-incident-2026-09-01.md §13.

Two entries are worth a second look, though neither is an orphan by the brief’s definition:

- **e7758398337f6aa7** — /tmp/.private/milosvasic (139.5 MB). This is an index of the *agent scratchpad root*, not a project. The path exists, so it classifies LIVE, but it indexes throwaway data and is the 4th-largest directory in the store. It is also the single most dangerous purge target — see the warning in §7.
- **d0d7a5956ee798fd** — <home>/Downloads (3.2 MB) and **97e1836a7eabe96a** — <home>/Downloads/flashing/1.2.1-dev-0.0.3 (0.1 MB, 0 files, 0 chunks). Also not projects.

These are judgement calls for the operator, not orphans. They are **excluded** from the reclaim commands below.

6. INCOMPLETE indexes — 227 dirs, 22.1 MB

These DBs open fine and have valid schemas, but project_meta contains **only** vec_dimensions = 768 — no project_path, no embedding_model, no root_hash, no last_indexed_at.

This is not an old-binary artefact. It is the signature of an **index run that was interrupted before it finished**:

Evidence	Reading
220 of 227 have rows in files	the file walk completed
1 of 227 has rows in chunks	embedding had barely started or not at all
0 of 227 record project_path	lumen writes it only on successful completion confirms the mechanism

Evidence	Reading
06dd1f85fde5febb looked identical — and is a <i>live, running</i> index	

So the write order is: create schema → walk files → embed chunks → **write project_meta and finalise**. Anything killed before the last step leaves exactly this fingerprint. With ~4 indexers running concurrently on this host and agent sessions being cancelled, a steady drip of aborted runs is expected.

Consequence for cleanup — this is the important part: lumen purge <path> matches on project_path recorded inside the DB. These 227 directories have no project_path, so **they can never be matched by any per-project purge**. Lumen's own help says the only supported way to remove them is bare lumen purge — which is exactly the irreversible, everything-including-the-active-rebuild command the operator must not run. They therefore require `rm -rf` of the specific directories, listed in §7.4.

Their contents are unrecoverable anyway: no path, relative filenames only, and essentially no embeddings.

7. Proposed commands

None of the following was executed. They are written for the operator to run, after the four indexers exit.

7.0 Preconditions — run these first, every time

```
# 1. Confirm NO indexer is running. Must print nothing.
ps -ef | grep -E 'lumen(-linux-amd64)? +index' | grep -v grep

# 2. Confirm the vasic rebuild finished and is intact (expect a
      project_path row).
sqlite3 'file:$HOME/.local/share/lumen/21bf1507a8925bcf/index.db?
      mode=ro' \
      'SELECT key,value FROM project_meta;'

# 3. Snapshot sizes so you can prove what was reclaimed.
du -sh ~/.local/share/lumen
```

7.1 Read this before running any purge

`lumen purge <path>` **normalises the path to its git root before matching** (the binary shells out to `git rev-parse`). Every DEAD path below **no longer exists**, so that normalisation cannot be verified in advance. There is a plausible failure mode:

- If lumen falls back to the nearest *existing* ancestor when a path is gone, then `lumen purge /tmp/.private/milosvasic/tmp.XXXX` could resolve to `/tmp/.private/milosvasic` — which is a **LIVE 139.5 MB index** (e7758398337f6aa7). You would delete the wrong thing, 511 times over.
- If lumen instead uses the path verbatim (the more likely behaviour: `git rev-parse` fails on a missing dir), the commands work as intended and unmatched paths simply print `No index found for <path>`.

This could not be settled without running purge, which was out of scope. So: dry-run on ONE path first.

```
# Canary. Note the size of the LIVE scratchpad index BEFORE:
du -sh ~/.local/share/lumen/e7758398337f6aa7 # expect ~140M

lumen purge /tmp/.private/milosvasic/tmp.Wi8cikm3Dw

# Now verify: 002451c5e88e19b1 should be GONE, e7758398337f6aa7
# must still be ~140M.
ls -ld ~/.local/share/lumen/002451c5e88e19b1 2>&1 # expect: No
# such file or directory
du -sh ~/.local/share/lumen/e7758398337f6aa7 # MUST still be
# ~140M
```

If e7758398337f6aa7 shrank or vanished, STOP. Do not run the bulk commands; use the `rm -rf` form in §7.4, which addresses index directories directly and cannot mis-resolve.

7.2 Tier 1 — DEAD ephemeral /tmp scratch indexes (524 dirs, 934.6 MB)

The bulk of the win. Batched to stay under ARG_MAX.

EOF

```
# 524 paths, all confirmed non-existent. Purge in batches of 50.
xargs -a /tmp/lumen-dead-paths.txt -n 50 lumen purge
```

7.3 Tier 2 — DEAD real project path (1 dir, 0.1 MB)

```
# <linux-host>/Projects – 0.1 MB, last indexed
    2026-06-28T09:53:08Z, index dir 0062e9326404910c
lumen purge <linux-host>/Projects
```

Sanity-check first: <linux-host>/Projects is a plausible former projects root on the internal /home filesystem (mounted). It was last indexed 2026-06-28T09:53:08Z and the directory is absent. Projects now live under <ext-volume-host>/Projects/, so this looks like a genuine relocation, not an unmounted volume.

7.4 Tier 3 — INCOMPLETE indexes (227 dirs, 22.1 MB) — NOT purgeable by path

lumen purge <path> **cannot** touch these (§6). Bare lumen purge would work but is forbidden — it destroys everything. The only targeted option is direct removal of the index directories.

```
# PRECONDITION: no lumen indexer running (§7.0). An in-flight
    index is
# byte-for-byte indistinguishable from these until it completes --
# 06dd1f85fde5febb proved exactly that during this inventory.

# Re-derive the list at run time rather than trusting this file's
    snapshot,
# so a newly-aborted (or newly-started) index cannot be caught by
    a stale list.
cd ~/.local/share/lumen
for d in */; do
    d=${d%/}
    [ -f "$d/index.db" ] || continue
    pp=$(sqlite3 "file:$d/index.db?mode=ro" \
        "SELECT value FROM project_meta WHERE
        key='project_path';" 2>/dev/null)
    [ -z "$pp" ] && echo "$d"
done | tee /tmp/lumen-incomplete.txt | wc -l    # expect ~227

# Review the list, then:
# xargs -a /tmp/lumen-incomplete.txt -I{} rm -rf ~/.local/share/
    lumen/{} 
```

The `rm -rf` line is left commented deliberately. 22.1 MB across 227 dirs is the smallest tier — the least payoff and the highest chance of clipping a running index. Consider skipping it entirely.

7.5 Never run

```
lumen purge          # ← NO ARGUMENTS. Irreversible. Wipes every
    index,           # including 21bf1507a8925bcf (the vasic
    rebuild),        #
    # boba (681.9 MB), lava (270.4 MB), and any index
    # currently being written. ~1.3 GB of live
    indexes          #
    # would need a full re-embed.
```

8. Duplicates

Zero. No `project_path` is recorded by more than one index directory. The 537 indexes that record a path map to 537 distinct paths, one-to-one.

The model-switch duplicate pattern the brief anticipated is absent, consistent with §1: a single embedding model and a single vector dimensionality across the entire store.

9. Method

- Every `index.db` opened with `sqlite3.connect("file:<path>?mode=ro", uri=True)` plus `PRAGMA query_only=1`. No write handle was ever taken. The four in-flight DBs were read through this path safely.
 - Sizes: byte-accurate `os.walk + lstat` per directory (includes `index.db`, `-wal`, `-shm`, `.lock`).
 - Liveness: `os.path.exists(project_path)`.
 - Mount state: `/proc/mounts`, `os.path.ismount()`, `lsblk`.
 - In-flight detection: `ps`, `lsof +D`, and `/proc/<pid>/fd` — the step that caught `06dd1f85fde5febb`.
 - `lumen purge` and `lumen index` were **not** run in any form. No file outside this report was created, modified, or deleted.
-

Appendix A — all 525 DEAD indexes

Recorded project_path for each, so the operator can confirm each is genuinely gone. All verified non-existent on mounted filesystems at inventory time.
