

requirements

Specification Quality Checklist: Workshop Curriculum Platform

Purpose: Validate specification completeness and quality before proceeding to planning **Created:** 2026-08-31 **Feature:** [spec.md](#)

Content Quality

- ☐ No implementation details (languages, frameworks, APIs)
- ☐ Focused on user value and business needs
- ☐ Written for non-technical stakeholders
- ☐ All mandatory sections completed

Requirement Completeness

- ☐ No [NEEDS CLARIFICATION] markers remain
- ☐ Requirements are testable and unambiguous
- ☐ Success criteria are measurable
- ☐ Success criteria are technology-agnostic (no implementation details)
- ☐ All acceptance scenarios are defined
- ☐

- ☐ Edge cases are identified
- ☐ Scope is clearly bounded
- ☐ Dependencies and assumptions identified

Feature Readiness

- ☐ All functional requirements have clear acceptance criteria
- ☐ User scenarios cover primary flows
- ☐ Feature meets measurable outcomes defined in Success Criteria
- ☐ No implementation details leak into specification

Validation Record

Validation was run twice. Iteration 1 found four genuine issues; all were fixed and iteration 2 passed. Both iterations are recorded, because a checklist that only shows its final green state hides whether it was ever capable of failing.

Iteration 1 — 4 items failed

Item	Finding	Resolution
Success criteria are technology-agnostic	SC-014 (“zero active server-side CI workflows”) names a delivery mechanism, not a user outcome.	Kept deliberately. It is not a design preference — it is a governing constraint from §11.4.156, which states “Non-compliance is a release blocker regardless of context. No escape hatch.” A spec that omitted it would let a later phase introduce a release blocker.

Item	Finding	Resolution
		Recorded as a knowing, justified exception rather than silently passed.
All functional requirements have clear acceptance criteria	FR-030 → FR-036 (documentation, evidence, governance) had no acceptance scenario in any user story; they were covered only by success criteria.	Accepted as covered: FR-030/031 by SC-004, FR-032/033 by SC-012/SC-013, FR-034 by SC-014, FR-035/036 by SC-015. Traceability is now explicit here rather than implied.
No implementation details	Acceptance Scenario 1 of User Story 1 specifies a <i>markdown</i> transcript — a format decision.	Kept. The operator’s description mandates markdown explicitly (“Create it as markdown document”), so it is a stated requirement, not an implementation leak.
Scope is clearly bounded	Three [NEEDS CLARIFICATION] markers left audience, corpus and video delivery open, so scope was not actually bounded.	Resolved as decisions D1–D3 , each choosing the safest, most stable option, with the reasoning and the conditions that would reopen it recorded. 0 markers remain.

Iteration 2 — all items pass

- 0 [NEEDS CLARIFICATION] markers (verified: `grep -c 'NEEDS CLARIFICATION' spec.md` → 0).
- 5 user stories, each with a stated priority, an independent test, and acceptance scenarios.
- 36 functional requirements, each phrased as an observable MUST.
- 15 success criteria, each carrying a number or a percentage.

- Scope bounded by an explicit Out of Scope list plus decisions D1–D3.

Requirement → Success Criterion Traceability

Every functional requirement group is measured by at least one success criterion, **with one recorded exception**: FR-039 has none. That exception was previously invisible because FR-039 sat inside another group’s row; it is now a row of its own, and the correction below states what enforces it instead.

Requirement group	Measured by
FR-001 ... FR-007 (transcription, source material)	SC-001, SC-002, SC-003
FR-008 ... FR-013 (curriculum, browsing)	SC-004
FR-014 ... FR-020 (search, cross-referencing)	SC-005, SC-006, SC-007, SC-008
FR-021 ... FR-025 (question answering)	SC-009, SC-010
FR-026 ... FR-029 (extension)	SC-011
FR-030 ... FR-031 (documentation)	SC-004
FR-032 ... FR-033 (evidence)	SC-012, SC-013
FR-034 ... FR-036 (governance)	SC-014, SC-015
FR-037 ... FR-038 (passage identity, correction)	SC-016, SC-016a
FR-039 (redaction before export or publication)	No success criterion measures it — see the correction below
FR-040 (evidence retention)	SC-018
FR-041 ... FR-042 (accessibility)	SC-017

Correction — 2026-09-01. This table previously grouped FR-037 ... FR-039 as one row measured by SC-016 and SC-016a. That was wrong at requirement granularity while reading as complete, which is the worst combination: SC-016 and SC-016a are **link-survival** criteria — they measure whether a citation still resolves after a correction, a re-index

or a symbol rename. Neither says anything about redaction. FR-039 is measured by **no success criterion at all**, and the honest record is to say so rather than to let an adjacent row cover for it.

FR-039 is nonetheless enforceable, by contract rather than by criterion, at three points:

Enforcement point	Where
Gate G-PID-5 — a redacted passage cannot be reached through search (R1), cross-references (R3) or a stored answer (R4)	contracts/passage-contract.md §7.3
Publish precondition B5 — redaction-review.json exists and is newer than the transcript	contracts/pipeline-cli.md §4.7
redact.sh --review-only — recording “ <i>none required</i> ” is a valid decision; skipping the review is not	contracts/pipeline-cli.md §4.6

Because there is no criterion, those three are the whole of FR-039’s enforcement. Removing any one of them makes the requirement decorative, and nothing else in the artifact set would notice.

Governance Cross-Check

The feature is governed by the constitution submodule. The clauses that constrain this spec:

Clause	Constraint	Where honoured
§11.4.156	No active server-side CI may be added. “No escape hatch.”	FR-034, SC-014
§1.1	Every gate needs a paired mutation proving it catches regressions.	FR-032, SC-012
§11.4 anti-bluff family	No claiming a result that was not observed.	FR-003, FR-019, FR-020, FR-022, FR-033, SC-010, SC-013

Clause	Constraint	Where honoured
§11.4.157	Four governance carriers stay in lockstep.	FR-035
§12.10	CONTINUATION.md updated alongside non-trivial work.	FR-035
§11.4.6	Never report an unverified state.	Context table records only measured values; FR-004 requires a measured accuracy figure rather than an assertion.

Clarify Session — 2026-08-31

Re-validated after `/speckit-clarify` integrated five clarifications.

Checkbox state: 16/16 → 16/16. No item newly passed; no item regressed. No markers were toggled. The spec grew from 36 to 42 functional requirements and from 15 to 18 success criteria; each new requirement was checked against the same criteria and none introduced an implementation detail, an unmeasurable outcome, or a new ambiguity.

The five clarifications closed these taxonomy gaps: passage identity and uniqueness; transcript lifecycle and provenance; privacy handling for an identifiable third party; evidence retention; and accessibility. The traceability table above was extended to cover the new requirements — had it been left alone, it would have understated coverage while still reading as complete.

Contracts Review — 2026-09-01

Phase 1 contract authoring surfaced one requirement that could not be met as written, and it was corrected rather than absorbed:

SC-016 claimed 100% link survival across every passage kind.

Achievable for passages the curriculum owns, because a minted identifier is anchored into the source artifact. NOT achievable for source code the curriculum does not own, where no anchor can be

written and identity must fall back to a symbol path. Split into SC-016 (owned, 100% by construction) and SC-016a (code, 100% of stale references fail LOUDLY rather than silently re-pointing). Left unqualified, implementation would have produced either an undocumented exception or a wrong-but-rendering link — the precise failure the criterion exists to prevent.

Requirement → Implementing Task Traceability — 2026-09-01

A cross-artifact analysis found two MUST-level obligations that were **fully contracted and entirely absent from the task breakdown**. Both were re-verified against the current artifacts before this section was written: `tasks.md` contained no FR-039 task (the string “redact” appeared exactly once, as a fixture kind in the unanswerable-question taxonomy), and it contained no occurrence of `symbol_aliases`, of rule R4, or of gate G-PID-4. Tasks now exist for both, and they are recorded here because a requirement→criterion table alone cannot show that a contracted obligation has an executor.

Task ids below are `tasks.md`’s post-2026-09-01 numbering (105 tasks).

FR-039 — redaction, required before any export or publication

Contracted at	Obligation	Task
passage- contract.md §7.1	Four-outcome <code>resolve()</code> ; redacted is a determined answer of its own, distinct from <code>not_in_registry</code> and from <code>undetermined</code>	T011
passage- contract.md §4.3, §7.3 R2/R6	Append-only redactions log; <code>passages.redacted</code> is a materialisation, never a bare column flip; <code>unredact</code> is an append	T012
pipeline-cli.md §4.6	<code>redact.sh</code> — arguments, three-valued exits, rebuild trigger	T038
pipeline-cli.md §4.6; §7.3 R7	<code>--review-only</code> and the <code>redaction-review.json</code>	T039

Contracted at	Obligation	Task
	artifact, with its staleness rule	
FR-039 as a live obligation	The Chapter 1 review itself — the recording features an identifiable third party	T040
passage-contract.md §7.3 R1, R5	Redacted pids excluded from FTS and from the embedding set at generation-build time ; degraded until rebuild	T059
passage-contract.md §7.3 R3; http-api.md §3.9	Cross-references suppressed; redacted_omitted count reported	T061
passage-contract.md §7.3 R4; http-api.md §3.10 A4	Stored answers withdrawn; a redacted citation ⇒ declined{redacted_evidence}	T075
passage-contract.md §7.3 gate G-PID-5	The composite proof, with its paired mutation	T076
pipeline-cli.md §4.7 B5	Publish precondition — review exists and is newer than the transcript	T087
pipeline-cli.md §4.7	add-chapter.sh covers all nine stages including redaction-review and publish	T084

The spread across five phases is deliberate, not fragmentation: redaction must propagate into each component **as that component is built**, and G-PID-5 cannot be proven until search, cross-references and stored answers all exist. None of it is Phase 8 work — a publication gate is not polish.

SC-016a — code-passage identity, keyed on symbol path with a rename alias table

Contracted at	Obligation	Task
		T014

Contracted at	Obligation	Task
passage-contract.md §10 P-U1	Settle the matching key's producer before building on it. Lumen exposes no symbol table through its CLI or MCP surface, so §6.2's key has no confirmed producer. Three-valued outcome; T015–T017 are blocked until it exits 0	
passage-contract.md §6.2, §6.4, §4.3 symbol_aliases DDL	The (path, symbol) key and the alias table, with authored separated from detected	T015
passage-contract.md §8 R2/R3/ R4	Ingest matching for code; an unaliased rename inside workshop/ fails ingest, outside it mints and orphans loudly	T016
passage-contract.md §6.5, §6.6, gate G-PID-4	The validating proof: aliased rename preserves the pid; unaliased rename resolves not_in_registry and ingest exits 1. Paired mutation: silent re-point by nearest-text match must turn the gate red	T017
FR-031	The limit stated honestly in the shipped documentation	T095

Previously SC-016a's only mention anywhere in the breakdown was the documentation task — which *documented* a guarantee that nothing implemented, and gate G-PID-4 appeared in no task at all.

P-U1 is handled by disclosure, not by assumption. T014 settles it and T015–T017 are explicitly conditional on that outcome, recorded both on each task and in tasks.md's Global Constraints. If T014 exits 1 — both candidate producers tested, neither yielding a stable symbol path — then SC-016a is not implementable as specified, and that becomes a recorded gap and an operator decision. The outcome forbidden either way is the one SC-016a exists to prevent: a heuristic that quietly re-points a citation at different code.

Notes

- The three resolved decisions (D1 local-only, D2 corpus scope, D3 local video reassembly) each record what would reopen them. If any is reopened, this checklist must be re-validated, because each one changes what “scope is clearly bounded” means.
- The spec deliberately contains one technology-flavoured success criterion (SC-014). This is justified above and should not be “cleaned up” by a later phase — removing it would remove a release-blocking constraint from view.
