

# redaction-review-summary

## Chapter 1 redaction review — public summary (T040 / FR-039)

**Counts and verdict only.** This file deliberately contains no chapter content, no personal name, no pid, and no transcript line reference. It exists so that a reader of the public umbrella repository learns *that* the review happened, *what* it found by category, and *what it concluded* — without learning any of the material it reviewed.

The review itself, with every finding located by path, line, segment index, pid and word index, lives in the **private** workshop submodule:

```
workshop/docs/redaction-review-chapter-01.md
```

Detail and locations belong there, not here — see docs/content-boundary.md. Naming a private path is allowed; reproducing what sits inside it is not, and nothing has been reproduced here.

T040 nominates no file in this directory for a summary, so this file was created for the purpose.

## Findings by category — counts only

| Category                                                 | Count                                                        |
|----------------------------------------------------------|--------------------------------------------------------------|
| Natural persons named                                    | 5 — of whom 3 are not parties to the recording               |
| Organisations named                                      | 1                                                            |
| Direct-identifier occurrences, total                     | 47 across 3 artifacts                                        |
| Distinct passages (pids) carrying a name or organisation | 12                                                           |
| Occurrences reachable by no pid at all                   | 1 — a document title line, structurally outside the registry |
| Indirect-identifier findings                             | 6                                                            |
| Third-party-confidential findings                        | 6                                                            |
| Redaction decisions recorded                             | 17 — 13 REDACT, 3 KEEP, 1 NOT REMEDIABLE                     |
| Passages currently marked redacted in the registry       | 10 — re-measured 2026-09-03                                  |

The row above used to read 0 of 11 622, and that figure is **WITHDRAWN, not restated**. It was true when this summary was written on 2026-09-02 and false a few hours later: redact.sh landed the same evening and operator decision 26 applied the Category 1 subset. Everything below marked **UPDATED 2026-09-03** moved with it.

## Measured negatives — actual empty results

Zero across all four in-scope artifacts: email addresses, @handles, URLs, bare domains, telephone numbers, IP addresses, home/user filesystem paths, organisation legal suffixes, identity-document references, credential values, high-entropy secret-shaped strings, repository URLs,

and any surname whatsoever. The curriculum exercise document and its sidecar, and the whole knowledge/ subtree of the chapter, contain **none** of the six confirmed name or organisation tokens.

## Mechanism coverage — UPDATED 2026-09-03

The registry carries a redacted field on every row and the API's redacted-passage path is proven on the invented fixture corpus.

**The claim this section used to carry — “*The tooling that would set it does not exist*”, naming `redact.sh` (T038), `redact.sh --review-only` and `chapters/NN/redaction-review.json` (T039), and the append-only redactions log (T012) as each measured absent — is WITHDRAWN.**

All four exist and have run. Measured 2026-09-03: `workshop/scripts/redact.sh` is present and executable; the review artifact is present and `redact.sh --check-review --chapter 01` exits **0** (“*is fresh; B5 is met for chapter 01*”); the append-only logs carry **10** passage records and **1** span record. The applying run reported **8 of 8** propagation targets reached, **0** PROBLEM · **0** UNDETERMINED.

Four propagation gaps are recorded in the private review, including one derived index that promotes every reviewed name to a first-class term row and carries no redaction field at all.

## Verdict — three-valued

| Question                                  | Answer                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| May the workshop gitlink be pushed as-is? | <b>SAFE — and already moot.</b> All four artifacts sit in the submodule's committed tree, and that commit has already reached its private remote. The umbrella exposes only a commit SHA. Recorded honestly: T040 wants the review <i>before</i> the commit, and the commit came first. <b>Measured 2026-09-03, so this is no longer asserted from memory:</b> the 2026-09-01 commit of the transcript carried <b>6 of the 10</b> currently-redacted passages' exact text and <b>0</b> redaction |

| Question                                        | Answer                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| May Chapter 1 be published, exported or served? | <p>markers; the 2026-09-02 commit carries <b>0 of 10</b> and 11 markers. The other 4 are COULD NOT DETERMINE — the registry text is today’s rendering and the older blob is 788 B larger, so their absence there is not evidence they were absent from that rendering.</p> <p><b>STILL NOT SAFE — but for ONE ground now, not two. UPDATED 2026-09-03.</b> The B5 half is WITHDRAWN: chapters/01/redaction-review.json exists, --check-review --chapter 01 exits <b>0</b>, and R7 no longer blocks. The <b>substantive</b> half stands and is the whole of the remaining answer: of the 13 REDACT decisions, <b>6 are applied (F1, F2, F4–F7) and 7 are DEFERRED (F8, F9, F12–F16)</b> by operator decision 26. <b>THAT CLAUSE IS WITHDRAWN 2026-09-03 (later the same day): all 13 are now resolved — 12 applied (F1, F2, F4–F7 under decision 26; F8, F9, F12–F15 under decision 28) and F16 needed no corpus change.</b> What still blocks publication is NOT the redaction backlog: it is (a) the review-level question of whether <b>2 of 27</b> withdrawn index terms, which a regeneration re-derives from still-VISIBLE passages, mean those passages must be withheld too, and (b) F17, which is NOT REMEDIABLE — already public, escalated. Category 2 indirect identifiers and Category 3 third-party-confidential material are</p> |

| Question               | Answer                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Anything undetermined? | <p>descriptive findings that no token-level redaction reaches, and they are untouched. This summary is still not the B5 artifact and must still not be counted as one.</p> <p><b>YES — 4 items, none of them a pass.</b> No consent record for the named third parties exists anywhere in the module; the identity of the referent behind the already-public occurrence below was not verified; the 108 KB transcript was swept exhaustively by pattern but not read exhaustively by eye (the private review states that coverage boundary precisely); and one organisation name is redacted on shape rather than on confirmed spelling.</p> |

## One finding is already public and is not fixable by redaction

A personal name appearing in the private chapter also appears in a **tracked, committed and already-pushed** file of this public repository:

```
| docs/setup-agents-wizard/LUMEN-STORE-INVENTORY.md
```

The occurrence sits in the committed tree, and that commit has reached the public remote. Same class as docs/content-boundary-incident-2026-09-01.md: a working-tree edit contains it and does not remedy it, and excising it from history is an operator call, not a cleanup. Exact locations are in the private review. The four other name probes return **zero** hits across every tracked file of this repository.

# Does this unblock T104? — UPDATED

## 2026-09-03

**Still no, and the reason has changed.** T104 is blocked on T040, and T040 has three parts: record the review, apply what it identifies, and re-emit the transcript asserting R2.

**The sentence this section used to carry — “*Only the first is done*”, with the apply half unable to run until T038 exists and the B5 artifact unwritable until T039 exists — is WITHDRAWN.** Both tools exist. Re-measured 2026-09-03: part 1 is **DONE**; part 3 is **DONE** — the applying run’s exports surface re-emitted the document and both sidecars (30 artifact-level changes), and the R2 assertion measures **0 violations** over 10 redacted rows × 2 fields × 3 surfaces, with the longest surviving common substring at **17 characters**; every third-party identifier reads **0** occurrences post-redaction, against **47** before.

**Part 2 is what remains, and it is now the sole blocker: 7 of the 13 REDACT decisions are deferred.** T040 must still not be ticked. **WITHDRAWN 2026-09-03 (later the same day): PART 2 IS APPLIED and T040 IS TICKED.** curriculum/redactions.jsonl went **10 -> 142** entries — **84** passages under six per-finding reason codes (F8 2, F9 6, F12 3, F13 2, F14 69, F15 2) plus **48** minted registry rows (36 kg\_term, 12 kg\_area) as the transitive closure of rows carrying a string that occurs in a withheld passage and in no visible ingested one. **F16 needed no corpus change**; the listing boundary it names was already in force. Final propagate exit **0**, targets reached (8/8), 0 PROBLEM · 0 UNDETERMINED, idempotent on re-run; §7.3 R2 re-measured at **0** residual across transcript.md, both timing sidecars, exercise-01.md, its sections sidecar, taxonomy.jsonl and area-materials.jsonl. The reproduction recipe and the full measured split live in tasks.md under T040.

**Two things did NOT close, and neither is a tooling defect.** (1) A regeneration from clean re-derives **2 of the 27** withdrawn index terms, and does so from passages that are still VISIBLE (3 visible occurrences each) rather than by reading withheld text — 25 of 27 do not come back. Whether those passages should also be withheld is a REVIEW decision about the corpus. (2) That regeneration’s own reconcile\_and\_taxonomy stage exits **2** on a 180-second minting-bridge timeout, so the row-level rebuild is UNDETERMINED; the extract stage completed (rc 0) and is what the sweep above measured.
