

catalogue

Contract — Catalogue

Governs the area list and the area detail. **Both are consumers of one publication decision**; neither re-implements it (R1, invariant I1).

GET /api/areas

Field	Guarantee
areas[]	Exactly the set whose href answers 200. Asserted end to end.
held_back[]	{id, reason} for every withheld area; a derived title/tags/summary when derivable.
reason_table	The closed reason vocabulary, in the same response.
total_areas	The population, so a filtered list never hides its denominator.
corpus_revision	What this catalogue was built from.

?include=held_back returns full objects for held-back rows — being withheld never makes an area unreachable.

tags is **never null**; an empty array instead.

GET /api/areas/{area}

Outcome	Body
published	the area

Outcome	Body
withheld	reason (closed vocabulary), published:false, whole_list, and an area object with derived title/ tags/summary when derivable
build inconsistent	503 — a broken build, not an editorial refusal

Why a withheld area still discloses its name: the reported symptom was a page saying only “withheld pending review”. An area held back for a missing review has a perfectly good name, and withholding it helped nobody.

Closed reason vocabulary

no_title · no_evidence · no_publication_review ·
stale_publication_review · no_materials_record · build_inconsistent

Three of these were previously computed by one handler and invisible to the other. **A shared vocabulary is not the fix** — both handlers already shared it. The fix is a shared *decision*.

Asserted by

verify-area-publication-consistency.sh (**0**, 6 passed / 0 failed / 0
undetermined) · prove-area-publication-consistency.sh (**0**, 7 passed /
7 mutations) · Go TestAreaListAndDetailAgree — the assertion on the
pair, which is what was missing while both handlers’ own tests passed.

Vacuity refusal **A6**: nothing served **and** nothing held back exits **2**,
never 0.
