

quickstart

Quickstart — validating this feature end to end

Feature: Authored AI/IT Knowledge Areas · **Date:** 2026-09-07

Runnable scenarios that prove the feature works. Every command below has been executed; where a result is **not** yet obtainable, that is stated rather than written as an expectation.

Exit-code contract throughout: 0 clean · 1 a real finding · 2 could not determine. A 2 is never a pass.

Prerequisites

- podman (no docker on this host)
- Go 1.26+, Node 20, Python 3
- The private workshop submodule initialised
- submodules/curriculum-kit present (it is a plain directory — see the caveat at the end)

0 — Build and unit gates

```
cd workshop/platform/backend  
go build ./... && go vet ./... && go test ./... -count=1
```

Expected: **rc 0**, 19 packages ok. Measured: rc 0 before and after this work.

1 — The catalogue tells the truth about itself (US1, FR-018)

The property: `areas[]` is exactly the set whose href answers 200.

```
bash workshop/platform/gates/verify-area-publication-  
consistency.sh  
bash workshop/platform/gates/prove-area-publication-consistency.sh
```

Expected: **0** — 6 passed / 0 failed / 0 could-not-determine, then **0** — 7 passed / 0 failed / 7 mutations. Both measured.

The prover’s mutations are **data**, read from `MUTATION=`; the stub’s source is byte-identical on every run. Mutation 0 is a control that must go **green** — a gate that failed on everything would “catch” everything and prove nothing.

Vacuity check A6: nothing served *and* nothing held back must exit 2. The prover asserts this, so a gate reporting “no inconsistencies” over an empty catalogue cannot pass.

2 — A test cannot be taken early, and cannot leak (US2, FR-010, SC-009)

```
bash workshop/platform/gates/verify-assessment-gate.sh  
bash workshop/platform/gates/prove-assessment-gate.sh
```

Expected: **0** — 9 passed, then **0** — 17 passed / 17 mutations. Measured.

Watch **B4/M7** specifically: it is the mutation that opens the gate as soon as *any* lesson completes, and it passes five of the other assertions. If you change the fixture so its required set equals its lesson set, B4 stops catching it — the fixture, not the gate, is what makes this detectable.

Vacuity checks B9/B10 exit 2 on a test gated on nothing.

3 — Video anchors resolve and land correctly (US3, FR-016, SC-008)

```
python3 workshop/pipeline/extract/verify_curriculum_areas.py  
python3 workshop/pipeline/extract/verify_curriculum_areas.py --  
prove-failure
```

Measured: plain run **rc 1** — A1 37 docs OK · A2/A3/A4 479 links, 0 link defects · A5 3 FAIL; prover **rc 0** at 11 passed / 0 failed, 11 mutations.

The rc 1 is correct and must not be silenced. The three failures are the three area documents with 62, 54 and 58 uncited claim blocks. Leaving them failing is the point; stamping them would be the bypass.

Spot-check one link by hand in the browser and confirm all four consumer obligations: the player is at t, the passage is in view **without scrolling**, it is visually distinguished, and the range extent is discernible.

4 — The whole learner journey (US1 + US2, SC-006)

```
bash workshop/platform/qa/challenges/api-challenges.sh
```

Measured: **rc 0**, 111 passed, 0 FAILED, 0 could not be determined.

Then, by hand: open the catalogue → open an area → read its lessons → attempt the test before finishing (expect a stated remaining requirement and **no** question text) → finish the lessons → take the test → read the result → reload and confirm the result is unchanged.

This journey CANNOT yet be completed against real content. Every real area answers a determined no_learning_catalog until curriculum/learning/NN-<slug>.json is authored. The six routes are proved against a synthetic bicycle-maintenance fixture only. This is a 2, not a pass, and it is the largest open item.

5 — Served state matches on-disk state (FR-023a, defect D8)

```
bash workshop/platform/gates/verify-server-unity.sh          # against the live container
bash workshop/platform/gates/verify-server-unity.sh --base    <fresh> # against a server built from this tree
```

Measured **right now**: against the live container **RED** — **PASS=37 FAIL=6**, all six the new routes answering a plain-text 404 because the container is running the **old binary**. Against a server built from this tree: **PASS=43 FAIL=0 UNDET=0 DEBT=8**.

This is the feature's own headline defect, live. A verified on-disk state is not evidence about what is served. It clears on restart:

```
bash workshop/scripts/restart.sh      # full down/up, never
                                     `compose restart`
```

Never pass --destroy-volumes to stop.sh. The workshop-index volume holds hours of transcription output.

Restart **once**, after every writer has stopped — a restart mid-write measures a tree that is still moving.

6 — Presentation (US5, SC-010, SC-011)

No instrument exists yet. SC-010 (≥ 6 hue families across principal surfaces) and SC-011 (contrast floors in both light and dark) have no check.

A check written here must read **the served stylesheet**, not the token source. A token-level measurement is evidence about tokens, and reporting it as evidence about the interface is exactly defect D6. Rebuild immediately before measuring and state which build was measured.

7 — Standalone cloneability (US6, FR-024)

```
bash workshop/scripts/verify-standalone-clone.sh
```

Measured: **3 gaps**, up from 2. The new row is truthful and is the gate working:

```
platform/backend/go.mod: replace target ../../../../submodules/
curriculum-kit
resolves OUTSIDE this repository and 'curriculum-kit' is not
declared in
helix-deps.yaml
```

submodules/curriculum-kit **is not a git repository**. It has no commit, so no truthful helix-deps.yaml entry can be written, and a fabricated ref: would be a bluff. **Inside the umbrella this builds; a standalone clone does not.** Remedy — publish it and mount it as a gitlink — is upstream and is an operator decision.

Summary of what this quickstart can and cannot prove today

Scenario	Status
0 Build and unit gates	PASS , rc 0
1 Catalogue consistency	PASS , rc 0 both arms
2 Assessment gating and non-disclosure	PASS , rc 0 both arms
3 Anchors resolve	rc 1, correctly — 0 link defects, 3 documents fail review
4 Full journey, synthetic	PASS , 111/0/0
4 Full journey, real content	UNDETERMINED — no authored catalogue yet
5 Served == on-disk	RED — container runs the old binary
6 Presentation	UNDETERMINED — no instrument
7 Standalone clone	1 real finding , blocked upstream
